### Attn: Christine Furlong, P.Eng. Project Manager

#### Ref: Town of Erin, Urban Centre Wastewater Servicing Class EA Effluent Outfall Site Selection, Technical Memorandum

Dear Ms. Furlong:

We are pleased to present our Technical Memorandum for the "Effluent Outfall Site Selection" for the Urban Centre Wastewater Servicing Schedule 'C' Municipal Class Environmental Assessment (EA).

This Technical Memorandum provides a review of the effluent outfall site alternatives for discharge of treated wastewater to the West Credit River and is based on the preferred general alternative solution identified in the Servicing and Settlement Master Plan (SSMP). The Technical Memorandum establishes and evaluates alternative sites for the effluent outfall as a component of Phase 3 and of the Municipal Class EA process.

Yours truly,

**AINLEY & ASSOCIATES LIMITED** 

Joe Mullan, P.Eng. Project Manager

#### **Glossary of Terms**

| ACS       Assimilative Capacity Study: see assimilative capacity.         Alternative Solution       A possible approach to fulfilling the goal and objective of the study or a component of the study.         Assimilative Capacity       The ability of receiving water (lake or river) to receive a treated effluent discharge without adverse effects on surface water quality, eco-system and aquatic life.         Benthic       Of, relating to, or occurring at the bottom of a body of water.         Build-out       Refers to a future date where all vacant and underdeveloped lots have been fully developed in accordance with the Town's Official Plan.         Municipal Class Environmental Assessment, a planning process approved under the EA Act in Ontario for a class or group of municipal undertakings. The process must meet the requirements outlined in the "Municipal Class Environmental Assessment" document (Municipal Engineers Association, October 2000, as amended). The Class EA process involves evaluating the environmental effects of alternative solutions and design concepts to achieve a project objective and goal and indudes mandatory requirements for public consultation.         CVC       Credit Valley Conservation Authority         Design Concept       A method of implementing an alternative solution(s).         Environmental       This approval covers emissions and discharges related to air, noise, waste or sewage.         Effluent       Liquid after treatment. Effluent refers to the liquid discharged from the WWTP to the receiving water.         Evaluation Criteria       Criteria applied to assistin identifying the preferred solution(s).  |                       |  |  |  |  |  |  |

### **1.0 Purpose and Study Background**

In 2014 the Town of Erin completed a Servicing and Settlement Master Plan (SSMP) to address servicing, planning and environmental issues within the urban areas of Erin Village and Hillsburgh. The aforementioned SSMP examined issues related to wastewater servicing and concluded that the preferred solution for both urban areas was a municipal wastewater collection system conveying wastewater to a single wastewater treatment plant located south east of Erin Village with treated effluent being discharged to the West Credit River.

In August of 2013, B. M. Ross concluded an Assimilative Capacity Study (ACS) establishing that a surface water discharge of treated effluent to the West Credit River was a viable alternative and suggested that the most suitable location for a WWTP outfall to the West Credit River would be situated between 10th Line and Winston Churchill Boulevard. It should be noted that the discharge from a WWTP was recommended to be located below Erin Village because of the greater assimilative capacity in this part of the river. The water quality records within this span of the river indicate lower contaminant concentrations than in other locations upstream. MOECC and CVC agreed with this approach. An update to the ACS during this Urban Centre Wastewater Servicing (UCWS) Class EA study has confirmed the viability of this location and has established effluent criteria that will permit both communities to be built out to full build out of the present OP. Whereas the SSMP recommended preferred alternative was a single treatment plant with a capacity of 2,610 m<sup>3</sup>/d, servicing a population of 6,000 persons, this UCWS Class EA study has identified a recommended preferred alternative treatment plant with a capacity of 7,172 m<sup>3</sup>/d servicing a population of 14,459 persons and the updated ACS confirmed this discharge capacity potential.

The Terms of Reference for this UCWS Class EA study require that alternative sites for the effluent discharge location be identified and evaluated and a recommended preferred site selected. The purpose of this memorandum is to identify alternative potential locations for the discharge of treated wastewater effluent to the West Credit River and to conduct a detailed evaluation to select the recommended preferred discharge site.

### **1.1. Related Documents and Projects**

Several related studies were completed prior to the commencement of the UCWS Class EA study. During Phase 1 of the UCWS Class EA, each of these studies was reviewed for pertinent information related to this project. They are described in brief in the following subsections.

### 1.2. Zoning Bylaw

The Town of Erin's Zoning Bylaw (No. 07-67) provides detailed information to control the development of properties within the Town. The bylaw regulates many aspects of development, including the permitted uses of property, the location, size, and height of buildings, as well as parking and open space requirements.

### **1.3.** Servicing and Settlement Master Plan (SSMP)

The SSMP was developed by B.M. Ross and Associates Limited (2014) with the goal to develop appropriate strategies for community planning and municipal servicing, consistent with current provincial, county and municipal planning policies. The SSMP process followed the Master Plan approach,

specifically Approach 1, as defined in the Municipal Class Environmental Assessment (Class EA) document, dated October 2000 (as amended in 2007 and 2011).

### 2.0 General Review of Potential Outfall Locations

The potential location for an effluent outfall site to the West Credit River was reviewed during the 2014 SSMP and a rationale was established for the location between 10<sup>th</sup> Line and Winston Churchill Boulevard where the assimilative capacity of the West Credit River is maximised. The updated Assimilative Capacity Study (ACS) completed for this UCWS Class EA has confirmed the validity of this stretch of the river as being suitable for the discharge from a water quality point of view.

The Collection System Alternatives Technical Memorandum completed as part of this UCWS Class EA study identifies a preferred collection system that conveys all wastewater to a Sewage Pumping Station at the South end of Erin Village and a forcemain from that Sewage Pumping Station that pumps all wastewater along Wellington Road 52 towards 10th Line. Wastewater treatment and disposal is therefore recommended to be located in the area of 10th line and Winston Churchill Boulevard (WCB). Based on this, Figure 1 shows the area for the potential locations of the outfall.

Figure 1 - Study Area for Potential Outfall Locations

As a first step in identification of alternative discharge locations, the following key aspects were considered:

- The need for permanent access to the discharge point to support collection of samples and maintain the discharge pipe and diffusers
- Minimising impacts to the natural environment during construction and operation
- Minimising impacts on the riverbed and banks
- Minimising the impacts on private property

The entire stretch of the river between 10th Line and Winston Churchill Boulevard is heavily wooded and privately owned. Locating an outfall anywhere along this stretch would require purchase of an easement from 10<sup>th</sup> Line to the potential discharge point from land owners (possibly several owners) and the removal of trees sufficient to create a permanent access road for construction of the pipeline and ongoing operation and maintenance activities. This would have a significant impact on the natural environment. In addition, the nature of the river along this stretch is such that there is no particular location that would present a natural outfall location.

### 3.0 Potential WWTP Discharge Outfall Sites

Based on the above, two locations were examined as potential discharge points.

- Where 10th Line crosses the West Credit River
- Where Winston Churchill Boulevard crosses the West Credit River

Both of these locations are fully accessible from public road allowances leading from the area of the proposed WWTP. A field review established that an outfall could be constructed within the public right of way on either side of the bridge on 10<sup>th</sup> Line and on the west side of Winston Churchill Boulevard. It is noted that the east side of Winston Churchill Boulevard is in Peel Region.

Three (3) alternative sites for the treated effluent outfall have been identified as follows:

- Alternative 1A 10th Line West Side
- Alternative 1B 10th Line East Side
- Alternative 2 Winston Churchill Boulevard West Side

In all three alternatives, the treated effluent will be discharged though the effluent pump station at the recommended WWTP site and conveyed through forcemains and gravity sewers to the discharge locations which are depicted in Figures 2 and 3.

A natural environment assessment was carried out along this stretch of the river including the above alternative sites, during June 2017 by Hutchinson Environmental Sciences Ltd (HESL). The HESL report forms part of the project documentation.

A Fluvial Geomorphological Assessment along this stretch of the river was carried out by Palmer Environmental Consulting Group Inc. This report is attached as an appendix to this Technical Memorandum.

A geotechnical field investigation along the routes of the proposed sewers/forcemains from the WWTP to the outfall alternative sites was carried out by GeoPro Limited, during October 2017 and this report also forms part of the project documentation.

Figure 2 – Wastewater Effluent Discharge Outfall Alternatives 1A and 1B

Figure 3 – Wastewater Effluent Discharge Outfall Alternative 2

### 3.1. Description of Alternatives

### 3.1.1. Alternative 1A/1B –10<sup>th</sup> Line

Alternatives 1A and 1B will consist of gravity sewers that run East on Wellington Rd 52 from the proposed WWTP Site and then North on 10<sup>th</sup> Line before discharging into the West Credit River. There is significant downwards slope on Wellington Rd 52 heading towards 10<sup>th</sup> Line and from the intersection of 10<sup>th</sup> Line North to the West Credit River bridge. As can be seen in Figure 4, there is enough room on the north shoulder of Wellington Rd 52 to place the discharge sewer within the shoulder and not in the road.

Figure 4 – Wellington Rd 52 facing West from 10<sup>th</sup> Line Intersection

The gravity discharge sewer will continue East on Wellington Rd 52 towards the intersection of Wellington Rd 52 and  $10^{th}$  Line. At the manhole within that intersection, the sewer will turn North on  $10^{th}$  Line. Figure 5 shows the view North down  $10^{th}$  Line from the Wellington Rd 52 /  $10^{th}$  Line intersection.

Figure 5 – 10<sup>th</sup> Line Facing North Towards West Credit River

There appears to be sufficient clearance from power lines to permit construction while retaining two-way traffic on 10<sup>th</sup> Line. As the sewer approaches the bridge over the West Credit River, there are two options for discharge: the West side of the bridge or the East side of the bridge. For Alternative 1A, the discharge is on the West side of the bridge.

It can be seen in Figure 6 that the road reduces to one lane over the bridge, however the sewer can still be constructed on the west side of the road allowance without affecting the bridge. The roadside barrier will need to be temporarily removed to allow construction of the sewer to the river. The CVC monitoring station will need to be protected during construction.

Figure 6 – 10<sup>th</sup> Line West Credit River Bridge (CVC monitoring station also pictured)

Figure 7 - Outfall Alternative 1A Discharge Location (Facing South)

In accordance with the recommendations in the Assimilative Capacity Study, the outfall will need to extend either along the bank for 5 metres with 15 equally spaced diffuser ports to disperse the effluent. Details of the diffuser will be developed during detailed design.

### 3.1.2. Alternative 1B –10<sup>th</sup> Line (East Side of bridge)

Alternative 1B is the same as Alternative 1A until the sewer nears the West Credit River bridge. At this point the discharge sewer will need to cross 10<sup>th</sup> Line and discharge into the river on the east side of the bridge. Figure 8 depicts the bridge area and the difference between Alternative 1A and 1B in more detail.

Figure 8 – 10<sup>th</sup> Line West Credit River Bridge for Alternatives 1A and 1B

The East side of 10<sup>th</sup> Line has a steep bank immediately off the shoulder making it difficult to construct the sewer. For this reason, Alternative 1B will need to cross the road at the point shown in Figure 8. Figure 9 shows the approximate outfall location for Alternative 1B.

Figure 9 - Alternative 1B Discharge Sewer Outfall Location (Facing South)

### 3.1.3. Alternative 2 – Winston Churchill (West Side of Bridge)

Alternative 2 will require a forcemain all the way from the WWTP site along Wellington Rd 52 to Winston Churchill Boulevard. This 1.6 km stretch of road slopes back towards 10<sup>th</sup> Line requiring the effluent to be pumped.

Figure 10 - Wellington Rd 52, From 10<sup>th</sup> Line Intersection Facing East

Figure 10 illustrates ample width of the shoulder available to place the forcemains with minimal impact on the existing road. The forcemains will follow the North shoulder of Wellington Rd 52 to a proposed manhole at the intersection with Winston Churchill Boulevard. From the intersection, a gravity sewer will convey effluent north, downhill along the west side of Winston Churchill Boulevard to the river. The sewer will require to be constructed down the west side of the road to remain in Wellington County. The road centreline represents the boundary between Wellington County and Peel Region.

Figure 11 - Winston Churchill Blvd Facing North from Wellington Rd 52 Intersection

Figure 11 also illustrates the narrowness of the shoulder and proximity to overhead power lines on the west side of the road. This will necessitate a lane closure of the road during construction. Due to the steepness of the road and height above the river, an energy dissipation manhole will be required to ensure an even velocity for dispersion into the river. The discharge will be as shown in Figure 12.

Figure 12 - Winston Churchill Blvd River Crossing and Alternative 2 Discharge

The same Alternative 1A/1B outfall structure will be used for the Alternative 2 discharge (Appendix A). Figures 13 and 14 show how the future sewer approaches the West Credit River.

Figure 14 - West Side of Winston Churchill Blvd River Crossing

It can be seen in Figure 15 that the outfall will discharge directly before the opening of the culvert crossing.

Figure 15 - Alternative 2 Outfall Discharge Location

### 3.2. Impact Analysis of Alternatives

### **Cost Impacts**

In order to compare the capital costs of the three (3) outfall sites, the following was considered:

- Costs of forcemain/sewer to convey treated effluent to each outfall site
- Costs for manholes/chambers for each outfall site
- Costs associated with any unique development features for each outfall site
- Costs for the actual outfall diffuser pipe.

Since all outfall scenarios require an effluent pumping station, this was not considered in the cost impact analysis. For the comparative analysis of the alternatives, costs were taken from the 10<sup>th</sup> Line/Wellington road intersection.

The peak flows for both Phases 1 and 2 of the WWTP were generated within our technical memorandum titled "Wastewater Treatment Technology Evaluation" and established as 11,779 m<sup>3</sup> /day (136.2 L/s) and 19,148 m<sup>3</sup> /day (221.6 L/s), respectively. These flows were used to size all discharge outfall alternatives. Unit costs were taken from the cost tables established in the "Collection System Alternatives Review". Once the forcemains reach the road, Alternatives 1A/B and Alternative 2 were sized and costed differently as shown in the following sections. The costs were generated from Tables 1, 2 and 3 which provide prices for installation of sewer pipe, forcemain and manholes.

- All costs are presented in 2016 Canadian dollars.
- Net present value costs are based on 80 years of operation, maintenance, and component replacement. Capital costs are excluded.
- Inflation and escalation to account for actual expected prices at the time of tendering cannot be accounted for at this time.
- Life cycle costs have been estimated based on an inflation rate of 4%.

For alternatives 1A and 1B, the gravity sewer size was determined to be a 350 mm diameter sewer based on a full build out peak flow of 19,148 m<sup>3</sup> /day (221.6 L/s) for both alternatives 1A and 1B. Based on that pipe size, the number of manholes shown in Figure 2, and an approximate outfall structure cost of \$30,000, the cost breakdown of these alternatives can be seen in Tables 1 and 2 below.

| Alternative 1A (350mm Gravity Sewer) |       |         |        |    |         |  |  |  |  |
|--------------------------------------|-------|---------|--------|----|---------|--|--|--|--|
| Units Unit Cost Cost                 |       |         |        |    |         |  |  |  |  |
| 350mm PVC Pipe                       | 588 m | \$      | 560    | \$ | 329,280 |  |  |  |  |
| Manholes                             | 4     | \$      | 10,000 | \$ | 40,000  |  |  |  |  |
| Outfall Structure                    | 1     | \$      | 30,000 | \$ | 30,000  |  |  |  |  |
|                                      | \$    | 399,280 |        |    |         |  |  |  |  |

### Table 1 – Alternative 1A Capital Cost

| Alternative 1B (350mm Gravity Sewer) |       |         |        |    |         |  |  |  |  |
|--------------------------------------|-------|---------|--------|----|---------|--|--|--|--|
| Units Unit Cost Cost                 |       |         |        |    |         |  |  |  |  |
| 350mm PVC Pipe                       | 590 m | \$      | 560    | \$ | 330,400 |  |  |  |  |
| Manholes                             | 4     | \$      | 10,000 | \$ | 40,000  |  |  |  |  |
| Outfall Structure                    | 1     | \$      | 30,000 | \$ | 30,000  |  |  |  |  |
|                                      | \$    | 400,400 |        |    |         |  |  |  |  |

### Table 2 – Alternative 1B Capital Cost

For Alternative 2, twin 300 mm diameter forcemains are proposed for the full build out flows. One air/vacuum relief valve chamber will also be required along Wellington 52 at the high point. From the intersection of Winston Churchill Boulevard and Wellington Rd 52 a 300 mm gravity sewer is required down to the river. Using these pipe sizes, the one proposed air chamber, and four proposed manholes, the cost breakdown of this alternative is shown in Table 3:

### Table 3 – Alternative 2 Capital Cost

| Alternative 2 (Twin 300mm Forcemains + 300mm Gravity Sewer) |        |           |        |    |           |  |  |  |  |
|---|--------|-----------|--------|----|-----------|--|--|--|--|
|   | Units  | Unit Cost |        |    | Cost      |  |  |  |  |
| Twin 300mm PVC Pipe   | 1696 m | \$        | 800    | \$ | 1,356,800 |  |  |  |  |
| 300mm Gravity Sewer   | 323 m  | \$        | 520    | \$ | 167,960   |  |  |  |  |
| Manholes  | 4      | \$        | 10,000 | \$ | 40,000    |  |  |  |  |
| Air Chambers  | 1      | \$        | 12,000 | \$ | 12,000    |  |  |  |  |
| Outfall Structure   | 1      | \$        | 40,000 | \$ | 30,000    |  |  |  |  |
|   |        |           | Total  | \$ | 1,606,760 |  |  |  |  |

The operation and maintenance costs for Alternative 1A/1B will involve routine maintenance of the short sewer section and energy costs for pumping from the WWTP to Wellington Road 52. Alternative 2 will involve a slightly higher cost for operation and maintenance of the forcemains, and a similar cost for the sewer section.

The design is based on twin 300 mm forcemains sufficient to accommodate full build out peak flow. Peak flow events are short duration, while most of the time the flow will be closer to average flow. Using twin 300 mm forcemains the velocity under peak flow will be 1.6 m/s whereas under average flow the velocity will be under 0.6 m/s requiring substantially less energy.

There will be added energy cost to pump effluent from the WWTP to the outfall location at Winston Churchill Blvd versus 10th Line. The preferred WWTP site will require an effluent pumping station so the effluent would be pumped from this location no matter where the discharge to the river is located. The capital cost of the effluent pumping station was included in the WWTP Treatment Process Selection Technical Memorandum. For WWTP Site 1 (Solmar) the effluent would be pumped to an elevation on Wellington Road 52 that is above the outfall pipe all the way to Winston Churchill Boulevard. Pumping along this outfall will require only 2.5 m of additional dynamic head under average flow condition. At full buildout, this results in an additional energy requirement of 76 KWh/day which represents \$4,000/year energy cost. The 80 year NPV for this extra energy cost is \$95,000.

The total lifecycle costs, including initial construction and 80 years of operational costs of each alternative are provided in Table 4.

### Table 4 – Total 80-year Lifecycle Costs

| Alternative                          | Estimated Lifecycle Cost |
|--------------------------------------|--------------------------|
| Site 1A (10 <sup>th</sup> Line West) | \$895,300                |
| Site 1B (10 <sup>th</sup> Line East  | \$ 896,400               |
| Site 2 (WCB West)                    | \$ 2,191,800             |

### Environmental Impacts

The Assimilative Capacity Study (ACS) completed by HESL in 2017 outlines and delineates effluent limits and objectives sufficient to ensure that effluent is not directly toxic to the aquatic environment, and determines the characteristics of the mixing zone and water quality at the point of complete mixing downstream of the effluent outfall site. Water quality modelling results are compared to Provincial Water Quality Objectives (PWQO) or Canadian Water Quality Guidelines to determine the potential for any impacts to aquatic biota. Water quality objectives and guidelines are protective of all forms of aquatic life and all aspects of the aquatic life cycles during indefinite exposure to water (MOE 1994).

There is an additional requirement that the effluent stream, at the point of discharge, not be acutely lethal to aquatic life.

The size and shape of the effluent plume and water quality in the mixing zone was modelled using the CORMIX water quality model (as required by MOECC) and oxygen and temperature modelling of the discharge was modelled using the Qualk2K model (HESL 2017). The 10th Line was used as the modelled effluent outfall location, but the results can be conservatively applied at Winston Churchill Boulevard since there is approximately 15% more dilution potential at Winston Churchill Boulevard due to inputs of groundwater between the two locations.

The HESL (2017) ACS concluded the following with respect to parameters most relevant to aquatic life, including fisheries and sensitive Brook Trout habitat in the study area:

- For the Full Build Out summer low flow scenario, dissolved oxygen concentrations were predicted to decrease by 1.33 mg/L to a minimum concentration of 6.39 mg/L at a distance approximately 700 m downstream of the WWTP discharge location and then begin recovering. As such, dissolved oxygen concentrations were predicted to remain well above the PWQO of 5 mg/L for cold water biota at river temperatures of 20°C and 25°C.
- Given that the maximum summer water temperature for the WWTP effluent of 19°C proposed by BM Ross (2014) is below the 75th percentile West Credit River water temperature of 21.18°C, the input from the WWTP effluent will slightly cool the river temperatures downstream of the outfall.
- A total ammonia effluent limit of 2.1 mg/L or less would meet the requirement for non-lethality during the summer discharge period. The distance to meet the PWQO for un-ionized ammonia of 0.02 mg/L is 153 m from the outfall at full build out and through implementation of a multiport diffuser. The mixing zone does not occupy the complete width of the river and meets all MOECC requirements for mixing zones.

From an Environmental perspective, the potential effluent outfall locations at 10th Line and Winston Churchill Boulevard were evaluated through the following criteria characterizing aquatic ecology conditions: water temperature, dissolved oxygen, Brook Trout redds and benthic invertebrate biological metric results.

Water temperature and dissolved oxygen data were gathered from HESL (2017) and compared at each site. Water temperatures were cooler in the summer at Winston Churchill Boulevard, as measured as maximum water temperature and 75th percentiles, because groundwater upwellings are abundant in the study reach upstream of Winston Churchill Boulevard. Dissolved oxygen concentrations were slightly higher as well at Winston Churchill Boulevard because of upstream groundwater inputs (HESL 2017). These provide more resilience and potential for assimilation of effluent and any associated changes in temperature and oxygen demand.

Only three Brook Trout redds were observed in the potential mixing zone within 153 m of the 10th Line. Dissolved oxygen was modelled to decline slightly downstream of the outfall. More Brook Trout redds (39) were observed within the oxygen sag zone downstream of the 10th Line than downstream of Winston Churchill Blvd (15). The benthic invertebrate assemblage at the 10th Line contained a greater proportion and a more diverse assemblage of sensitive invertebrates.

Based on Environmental considerations, the preferred effluent outfall location to the West Credit River is Winston Churchill Boulevard because of the presence of more sensitive aquatic features and functions at the 10th Line and the density of Brook Trout redds downstream. Treated effluent discharged at the 10th Line would flow downstream through the sensitive study area to Winston Churchill Blvd. and beyond but an outfall location at Winston Churchill Blvd. would avoid the most sensitive area altogether, initial mixing would occur within the culvert where habitat has already been impacted and there is ~ 15% more assimilation flow (HESL 2017).

### Agricultural Impacts

There are no agricultural impacts associated with construction at the sites.

### Fluvial Geomorphological Impacts

Based on the results of the fluvial geomorphological assessment, all alternative sites would provide suitable effluent discharge locations. The study indicates that the discharge would not impact the stream bed or banks to any meaningful extent.

#### Archaeological Impacts

Construction of all the treated effluent outfall alternatives will be completed in public rights of way (road allowances) including the actual outfall locations at the West Credit River. As such, all of the disturbed lands are previously disturbed for construction of the road or bridge works. It is not anticipated that archaeological impacts will be significant for any of the alternatives.

### Geotechnical Impacts

All of the construction of the treated effluent outfall alternatives will be completed in public rights of way (road allowances) including the actual outfall locations at the West Credit River. As such, all of the disturbed lands are previously disturbed for construction of the road or bridge works. It is not anticipated that archaeological impacts will be significant for any of the alternatives.

### 4.0 Evaluation Methodology

The evaluation methodology used to select the preferred treated effluent outfall site was established in a manner consistent with the principles of environmental assessment planning and decision-making as outlined in Municipal Class Environmental Assessment.

A decision model consistent with the principles of environmental assessment planning and decision making as outlined in Municipal Class Environmental Assessment manual was developed to select the preferred outfall site.

In developing the decision model, relevant and specific evaluation criteria were identified and compared distinguishing features between the sites. Whereas other components of the UCWS Class EA place a higher emphasis on Technical Criteria, for the outfall site selection evaluation, Environmental and Economic Criteria play a more important role.

Based on the above, the three (3) Alternative Sites (Site 1A, 1B, and 2) will be evaluated against the specific evaluation criteria described in the Table 4 below:

| Primary Criteria  | Weight | Secondary Criteria                          | Weight |
|-------------------|--------|---|--------|
|                   |        | Impacts During Construction                 | 30%    |
|                   |        | Aesthetics (Appearance of discharge)        | 40%    |
| Social/Culture    | 10%    | Effect on Residential Properties            | 10%    |
|                   |        | Effect on Businesses/ Commercial Properties | 10%    |
|                   |        | Effect on Industrial Properties             | 10%    |
|                   | 10%    | Functionality and Performance               | 30%    |
| Technical         |        | Suitability for Phasing                     | 10%    |
| rechnical         |        | Constructability                            | 30%    |
|                   |        | Operation and Maintenance Impacts           | 30%    |
|                   |        | Effect on Surface Water/ Fisheries          | 50%    |

### Table 5 – Outfall Alternatives Evaluation Criteria

### 4.1. Screening Criteria Definitions

### 4.1.1. Social/Culture, Impacts During Construction

This criterion captures the level of disturbance to the community the proposed solution will have during the construction period. These effects include noise levels, vibration, odours, dust production, as well as the amount of time for which these disturbances will persist.

### 4.1.2. Social/Culture, Aesthetics (appearance of Discharge)

This criterion captures the level of impact from the visual appearance of the outfall and discharge to the river.

### 4.1.3. Social/Culture, Effect on Residential Properties

This criterion captures the level of impact that the outfall has on individual residential properties. Impacts considered include operation and maintenance activities.

### 4.1.4. Social/Culture, Effect on Commercial Properties

This criterion captures the level of impact that the outfall has on individual commercial properties. Impacts considered include operation and maintenance activities.

#### 4.1.5. Social/Culture, Effect on Industrial Properties

This criterion captures the level of impact that the outfall has on individual industrial properties. Impacts considered include operation and maintenance activities.

#### 4.1.6. Technical, Functionality and Performance

This criteria compares the methods of conveying the effluent to the outfall location (pumping or gravity) and the technical suitability of the sites to accept and mix the effluent into the river.

#### 4.1.7. Technical, Suitability for Phasing

This criterion captures the ability to be expanded under a phased development plan. Outfall locations that allow flexibility in development to promote ease of expansion would have a higher score.

#### 4.1.8. Constructability

This criterion captures the constructability of each alternative. This would include geotechnical aspects and hydrogeological aspects affecting structural design of the outfall.

#### 4.1.9. Technical, Operational and Maintenance Impacts

This criterion captures the impacts of each site on the operability of the overall system. This would take into consideration, access to the outfall sites and level of effort required by operations staff to operate and maintain the outfall.

#### 4.1.10. Environmental, Effect on Surface Water/ Fisheries

The criterion captures the impact that the establishment and operation of the outfall alternative has on the local surface waters both during construction and over the long term and in terms of impacts to water quality and fisheries. Minimizing contamination of the local surface water is rated favourably.

#### 4.1.11. Environmental, Effect on Vegetation/ Wetlands

The criterion captures the impact that the establishment and operation of the system alternative has on the local vegetation and wetlands both during construction and over the long term. Minimizing negative impacts on the local vegetation and wetlands is rated favourably.

### 4.1.12. Environmental, Effect on Groundwater

The criterion captures the level of groundwater contamination associated with the establishment and operation. Minimizing contamination of the local groundwater is rated favourably.

#### 4.1.13. Environmental, Effect on Habitat/ Wildlife

The criterion captures the impact that the establishment and operation of the system alternative has on the local habitat and wildlife both during construction and over the long term. Minimizing contamination of the local habitat and wildlife is rated favourably.

### 4.1.14. Economic

The criterion captures the estimated cost to construct the alternative and to operate and maintain the system on an annual basis.

### 4.2. Evaluation of Alternatives

### 4.2.1. Overview

As discussed in Section 3.0 above, the following three (3) alternatives for outfall were developed:

- Alternative 1A 10<sup>th</sup> Line (West Side of Bridge)
- Alternative 1B 10<sup>th</sup> Line (East Side of Bridge)
- Alternative 2 Winston Churchill Blvd (West Side of Crossing)

A description and layout of these options can be found in Section 3.0.

### 4.2.2. Detailed Evaluation of Outfall Alternatives

The evaluation of each of the outfall alternatives, using the criteria and weightings listed in Table 4 is provided in Table 5.

Using the weighted percentages assigned to each category and criteria, each criteria is then scored from 1 to 5 with one having the most negative effect and 5 the least negative impact. The highest score therefore represents the preferred alternative.

### Table 6 – Weighted Scoring of WWTP Outfall Site Alternatives

| Primary Criteria |        | Secondary Criteria                          |        |     | Site 1A (10t | te 1A (10th Line West) Site 1B (10th Line East) Site 2 (Winston Churchill Blvd West) |       | Site 2 (Winston Churchill<br>Blvd West) |       |          |                         |

erably more expensive alternative

## 5.0 Conceptual Outfall Design

The conceptual design of the outfall at the preferred location at Winston Churchill Boulevard is shown in Figure 16. The conceptual design shows the full extent of the outfall within the existing property line.

### 6.0 Conclusions and Recommendations

- The 2014 Servicing and Settlement Master Plan (SSMP) identified a general area for a discharge of treated effluent to the West Credit River south east of Erin Village.
- The UCWS EA is a continuation of the Class EA process and aims to establish the preferred design alternative for the wastewater system servicing Erin Village and Hillsburgh.
- The updated Assimilative Capacity study completed for the UCWS Class EA study confirmed the suitability of the general effluent discharge area identified in the SSMP.
- The proposed treated water effluent Limits and Objectives for the discharge as outlined in the ACS confirm that all alternative outfall locations provide acceptable locations from a water quality perspective.
- Based on the above and a more detailed examination of the area, this UCWS Class EA study has
  refined the general area for the potential treated effluent outfall and selected three (3) sites within this
  area for more detailed evaluation.
- The three (3) alternatives effluent outfall sites are defined as follows:
  - Site 1A 10th Line West Side
  - Site 1B 10th Line East Side
  - o Site 2 Winston Churchill Boulevard West Side
- The Outfall Alternatives were sized, conceptually designed and costed.
- In addition to the Assimilative Capacity Study, a Natural Environment Study, a Fluvial Geomorphological Study and Geotechnical study were undertaken for the river between 10th Line and downstream of Winston Churchill Boulevard and the outfall pipe routes from a potential WWTP site to assist with defining potential impacts.
- The team has compiled sufficient information on the environmental, geotechnical, archaeological and costing aspects of the sites to support an evaluation process aimed at selecting the preferred site.
- The evaluation criteria were established with the following weighting for the primary criteria:
  - Social/ Cultural Impacts 10%
  - Technical Impacts 10%
  - Environmental Impacts 60%
  - Economic Impacts- 20%
- The evaluation criteria reflect the relative importance of the criteria on water quality and the potential impact on fisheries as well as cost
- The relative 80-year lifecycle costs, covering initial construction and 80 years of operational costs for each site are summarized as follows:

| Alternative                          | Estimated Lifecycle Cost |
|--------------------------------------|--------------------------|
| Site 1A (10 <sup>th</sup> Line West) | \$895,300                |
| Site 1B (10 <sup>th</sup> Line East  | \$ 896,400               |
| Site 2 (WCB West)                    | \$ 2,191,800             |

- In addition, Alternative 2 will require additional pumping costs to pump the effluent to Winston Churchill Boulevard.
- Environmental impacts for Alternative 2 are summarized as follows:
  - o Water temperature is lower and oxygen levels higher at Winston Churchill Boulevard
  - Lower impact on Brook Trout and benthic invertebrates
- Geotechnical impacts are summarized as follows:
  - Prevalent sand and gravel deposits in the area will not present major construction issues for outfall pipelines until close to the river where groundwater will affect construction. It is anticipated that dewatering will be required for the 100 m closest to the river. This applies to all alternatives.
- Archaeological impacts are not expected to be significant for any of the alternatives.
  - Since all of the works will take place in established road allowances, it is not anticipated that archaeological resources will be encountered.
- A Fluvial Geomorphological assessment confirmed that all potential outfall locations are suitable and will not cause erosion or affect the existing channel
- The results of the evaluation process indicate that, Alternative 2 (Winston Churchill Boulevard) has the highest score and is preferred over sites 1A and 1B.
- The primary reasons for this are:
  - The potential impact on Brook Trout and fisheries in the river reach downstream of 10th Line
  - Lower water temperature and higher oxygen levels at the Winston Churchill Boulevard location
  - Opportunity for improved mixing at Winston Churchill Boulevard location
- In examining the sensitivity of the scoring to changes in the criteria weightings, it should be noted that a 4% decrease in the Environmental weighting and corresponding 4% increase in the Economic weighting would result in Alternative 1A or 1B being the preferred Alternative. In this case the Environmental criteria has been rated highly because of the potential impact on brook trout which represents a valuable resource for the West Credit River. While the high quality effluent will protect river water quality and all of the fish species, there remains a risk to this sensitive and significant resource which cannot be mitigated.
- The recommended effluent limits are protective of all fish at all critical life stages and so meet the requirements for protection of aquatic habitat. Mitigation to be considered during design to achieve an even higher level of protection, in consideration of the resident population of Brook Trout are outlined below:
  - Any in-stream work should adhere to Fisheries and Oceans Canada's in-stream construction timing windows for spring (March 15 to July 15) and fall spawners (October 1 to May 31) to protect the sensitive life stages of spawning and rearing for resident species such as Rainbow and Brook Trout.
  - An Erosion and Sediment Control Plan should be developed to prevent runoff and solids from entering the river. A construction mitigation plan should be developed (CISEC Canada 2012)
- A monitoring plan should be developed in combination with the regulatory WWTP effluent monitoring to assess the response of the river to the effluent discharge. The monitoring plan will ultimately be

reviewed by CVC and regulated through the ECA and should include an assessment of fisheries, benthic invertebrates and aquatic habitat with sufficient effort to allow for natural variability to be controlled and allow for a sensitive determination of any impact.

# Appendix A Fluvial Geomorphological Assessment

# Fluvial Geomorphological Assessment of West Credit River to Support Siting of a Proposed WWTP Discharge Location

Prepared for

Hutchinson Environmental Sciences Ltd.

Dear Ms. Sinclair,

### Re: Fluvial Geomorphological Assessment of West Credit River to Support Siting of a Proposed WWTP Discharge Location

Palmer Environmental Consulting Group Inc. is pleased to provide the results of our fluvial geomorphological assessment of West Credit River between 10<sup>th</sup> Line and Winston Churchill Boulevard, in the Town of Erin, in support of the overall Class Environmental Assessment for urban centre wastewater servicing.

The subject reach of West Credit River is an irregular-meandering, partly confined channel that has adopted a stable cross-sectional form and pool-riffle bed morphology. The proposed effluent discharge (0.083 m<sup>3</sup>/s) will have negligible impact on erosion processes along West Credit River, and the two proposed discharge locations (10<sup>th</sup> Line and Winston Churchill Boulevard) are both morphologically stable.

Should you have any questions, please do not hesitate to contact Robin McKillop at 647-795-8153 (ext. 106) or robin@pecg.ca.

Yours truly, Palmer Environmental Consulting Group Inc.

Ah hi

Robin McKillop, M.Sc., P.Geo., CISEC Principal, Senior Fluvial Geomorphologist

# **1** Introduction

Palmer Environmental Consulting Group Inc. (PECG) is pleased to provide Hutchinson Environmental Sciences Ltd. (HESL) with the results of our fluvial geomorphological assessment of West Credit River, between 10<sup>th</sup> Line and Winston Churchill Boulevard, in the Town of Erin (**Figure 1**). The fluvial geomorphological assessment will support the overall Class Environmental Assessment for urban centre wastewater servicing in the Town of Erin, which includes a proposed wastewater treatment plant (WWTP) along County Road 52. Effluent from the WWTP will discharge into West Credit River. A fluvial geomorphological assessment is required as a basis for evaluating the morphological implications of increased flow in West Credit River. As well, the assessment encompassed candidate discharge locations, with an emphasis on documenting and analyzing conditions in the areas most sensitive to increases in flow.

# 2 Methods

The fluvial geomorphology of West Credit River was assessed through a combination of desktop and field investigations. We reviewed a number of important background information sources for the study area, including Credit Valley Conservation's (CVC) 2005 and 2013 Watershed Report Cards, Management Plan Credit River Fisheries (2002), and Rising to the Challenge: A Handbook for Understanding and Protecting the Credit River Watershed (2009); 50 cm topographic contour data provided by HESL; and Ontario Geological Survey bedrock and surficial geology mapping (Ontario Geological Survey, 2014a,b). Orthophotography (2010) of the study area and Google Earth (2004, 2006, 2012, 2013, 2014, 2015, 2016) provided a basis for characterizing channel conditions in West Credit River.

Field reconnaissance and detailed data collection were completed on June 28, 2016 by PECG's Fluvial Geomorphologist during baseflow conditions without any significant antecedent precipitation. West Credit River was walked from ~400 m upstream of 10<sup>th</sup> Line to ~350 m downstream of Winston Churchill Boulevard to observe channel conditions, examine patterns and processes of local erosion, determine channel reach breaks, and ground truth aerial photograph-based interpretations. Furthermore, a Rapid Geomorphic Assessment (RGA; Ontario Ministry of the Environment, 2003) was completed along the study reach to document evidence of channel aggradation, degradation, widening and planimetric form adjustment. The RGA tool provides a useful checklist of evidence to consider, but its results are dependent on the presence or absence of a set number of specific features within a reach and thus must be interpreted carefully to ensure accuracy (McKillop, 2016).

Detailed data were collected at three sites in order to establish erosion thresholds: ~100 m downstream of 10<sup>th</sup> Line, ~100 m upstream of Winston Churchill Boulevard, and ~100 m downstream of Winston Churchill Boulevard (**Figure 1**). The three sites were deemed likely WWTP discharge locations through consultation with HESL (the proposed WWTP discharge locations were not determined at the time of the field work). Four to five cross-sections and a longitudinal profile were surveyed at each site according to CVC Fluvial

Geomorphic Guidelines (2015). The surveyed cross-sections were strategically positioned in representative morphological units (e.g. pools, riffles). Bankfull dimensions were based on field indicators defining the principal limit of scour, including abrupt changes in bank vegetation, material and steepness (Harrelson et al., 1994), which is assumed to represent the 'channel-forming discharge'. The grain size distribution of the alluvial material within each site was determined through modified Wolman (1954) pebbles counts.

All bed erosion threshold and critical discharge analyses were completed based on a Shields (1936) approach as outlined by Church (2006), as it is a semi-empirical approach (as opposed to completely empirical) and is well-suited for gravel bed rivers. A bed erosion threshold is the hydraulic condition at which the channel bed is in a state of incipient motion, and the critical discharge is the flow that produces that threshold condition at a particular location along the channel. Iterative hydraulic simulations were completed to determine the flow at which the erosion threshold is exceeded (i.e. critical discharge).

# **3 Physical Setting and Historical Changes**

The Credit River watershed is within the Regional Municipality of Peel, Regional Municipality of Halton, Wellington County, and Dufferin County. Major urban centers within the watershed include Caledon, Brampton and Mississauga. The entire watershed encompasses 871 km<sup>2</sup> and the main branch of Credit River is ~90 km long and contains over 1,500 km of tributaries (Credit Valley Conservation, 2002). The Niagara Escarpment, a major topographic feature, runs diagonally across the watershed. The headwaters of Credit River, including West Credit River, are located above the Niagara Escarpment. Streams above the Niagara Escarpment have remained in a relativity natural condition (Credit Valley Conservation, 2009).

The West Credit River subwatershed comprises hummocky moraines and drumlins (Guelph Drumlin Field) as well as glacial spillways, yielding undulating topography (Credit Valley Conservation, 2009). Within the study area, the West Credit River flows within a valley dominated by glaciofluvial deposits and the channel is underlain by modern alluvial deposits. Prominent fluvial terraces are present along the edges of the valleys (Ontario Geological Survey, 2014b). The coarse sands and gravels of the surficial material are highly permeable and support high infiltration rates. As such, baseflow in West Credit River is maintained from groundwater discharge. Maximum stream flow typically occurs in late winter or early spring as a result of snowmelt or rainfall on frozen ground, or a combination of both. High intensity summer storms also lead to high flow events. Stream monitoring conducted by CVC in 2003 suggests that watercourses within the West Credit River subwatershed are stable channels that are "In Regime" (Credit Valley Conservation, 2009).

Traditionally, agricultural (primarily beef cattle farming) has been a dominant land use in the upper Credit River watershed; however, there has been a significant decrease in the amount of land cultivated in recent decades. Deciduous forests and white cedar swamps are common atop the Niagara Escarpment and it is estimated that 60% of the upper watershed is forested (Credit Valley Conservation, 2009). Upstream of the study reach, land use is mostly natural areas and agricultural. Furthermore, the West Credit River catchment has many wetland complexes that moderate flood flows (Credit Valley Conservation, 2002).

Start of backwatered conditions as a result of downstream rock weir

Study Area and Detailed Data Collection Sites

# **FIGURE 1**

# **4 Description of Channel Morphology**

A description of channel morphology at the reach scale is provided in Section 4.1. Results of the site-scale detailed data collection, including the erosion threshold analyses, is documented in Section 4.2.

## 4.1 Reach Scale

A partly confined reach extending from ~50 m upstream of 10<sup>th</sup> Line to ~350 m downstream of Winston Churchill Boulevard was identified (**Figure 1**). Upstream of the reach, West Credit River is unconfined and low gradient and contains many large woody debris (LWD) jams. Downstream of the reach, the channel is significantly backwatered upstream of an anthropogenic rock weir. The identified reach exhibits a low-sinuosity, irregular meander pattern and is partly confined by prominent fluvial terraces and valley walls. The channel has a moderate gradient and, generally, has a defined pool-riffle bed morphology with pools located near the apices of meanders. The pool cross-sections tended to be asymmetric with larger depths along the outer bank, whereas riffles are typically symmetrical.

Bed material in the riffles is mostly coarse gravel and cobble derived from erosion of the underlying glaciofluvial materials. The coarser cobble particles are commonly covered in aquatic lichens and mosses, indicating they are rarely entrained (**Photo 1**). The bed material in the pools is dominated by gravel covered with a thin veneer of silts and sands. Bank materials are dominated by alluvial sands and silts. The channel banks are well-vegetated and have gentle slopes. Minimal bank and bed erosion was observed within the reach. The riparian vegetation, which is a mixture of herbaceous and mature forest, has locally been cleared near residential properties. Throughout the reach, fallen/leaning trees line the channel banks and many LWD jams are present (**Photo 2**). The jams locally perturb the energy gradient, cause local channel braiding/cutoffs, and store significant volumes of gravel (**Photo 3**). Furthermore, five anthropogenic rock weirs were observed adjacent to the residential properties (**Photo 4**). The rock weirs cause local channel impoundment but have minimal impact on channel morphology at the reach scale.

Overall, the study reach of West Credit River exhibits only minor departures from a state of dynamic equilibrium with an RGA Stability Index of 0.29 (**Table 1**). According to the RGA, aggradation and widening were the dominant modes of adjustment based on the following observations: embedded coarse material in riffles, siltation in pools, deposition in overbank zone, fallen/leaning trees, occurrence of large organic debris, exposed tree roots. Based on professional interpretation of reach-scale geomorphological form and processes, the channel lacked strong evidence of a dominant mode of channel adjustment and was in a state of dynamic equilibrium. Localized channel instabilities were, for the most part, caused by LWD jams.

## 4.2 Site Scale

All three detailed data collection sites had similar bankfull channel dimensions (**Table 2**) and bankfull channel hydraulics (**Table 3**). The width to depth ratios are greater than 20 at all three sites, indicating the channel has good access to its floodplain (i.e. is not entrenched). Due to increases in cross-sectional area, the bankfull discharge increased in the downstream direction. All three sites have sub-critical flows conditions (Froude Number < 1) at bankfull conditions.

| Measure                                | Site 1 | Site 2 | Site 3 |
|--|--------|--------|--------|
| Width (m)                              | 11.62  | 13.25  | 13.25  |
| Average Depth (m)                      | 0.52   | 0.52   | 0.66   |
| Maximum Depth (m)                      | 0.71   | 0.65   | 0.88   |
| Width:Average Depth                    | 22.56  | 26.43  | 20.06  |
| Cross-sectional Area (m <sup>2</sup> ) | 6.02   | 6.80   | 8.83   |

Table 2. Averaged bankfull channel dimensions

#### Table 3. Averaged bankfull channel hydraulics

| Measure                                  | Site 1 | Site 2 | Site 3 |
|--|--------|--------|--------|
| Energy Gradient (m/m)                    | 0.0028 | 0.0036 | 0.0025 |
| Discharge (m <sup>3</sup> /s)            | 6.23   | 9.51   | 10.49  |
| Average Velocity (m/s)                   | 1.03   | 1.38   | 1.18   |
| Froude Number                            | 0.46   | 0.62   | 0.46   |
| Average Shear Stress (N/m <sup>2</sup> ) | 13.82  | 24.84  | 15.85  |

Notes: Manning's 'n' assumed to be 0.035 for all-cross-sections for the full range of flows because the beds are level with water levels much deeper than the grains are in diameter and the channel had moderate sinuosity (Hicks and Mason, 1998)

All three sites had similar grain size distributions dominated by gravels (**Table 4**). The critical discharge was lowest at Site 2, likely because it had the steepest energy gradient that induces entrainment of the gravel bed material more readily than the other two sites (**Table 5**). The critical discharges ranged from 52 to 84% of bankfull discharge, indicating there are few sediment transport inducing events in a given year. The stable pool-riffle morphology and moss-covered cobble corroborate these critical values.

| Measure         | Site 1 | Site 2 | Site 3 |
|-----------------|--------|--------|--------|
| D <sub>16</sub> | 5      | 9      | 5      |
| D <sub>35</sub> | 13     | 18     | 16     |
| D <sub>50</sub> | 22     | 26     | 24     |
| D <sub>65</sub> | 35     | 34     | 35     |
| D <sub>84</sub> | 58     | 70     | 90     |

Notes:  $D_x$  is the grain size than which X% of the substrate is finer

#### Table 5. Critical hydraulic conditions

| Measure                                   | Site 1 | Site 2 | Site 3 |
|---|--------|--------|--------|
| Critical Shear Stress (N/m <sup>2</sup> ) | 16.02  | 18.81  | 17.16  |
| Critical Discharge (m <sup>3</sup> /s)    | 5.21   | 4.91   | 7.84   |
| % of Bankfull Flow                        | 84     | 52     | 75     |

Notes: Critical Shields parameter used to calculate erosion thresholds was 0.045 because the channel had stable gravel-cobble bedforms (Church, 2006)

## **5 Effluent Discharge Rate and Location**

The following information regarding the effluent discharge rates and location was provided to PECG by HESL in February 2017:

- The proposed effluent discharge will be a constant 0.083 m<sup>3</sup>/s
- The 7Q20 flow for the subject reach of West Credit River is 0.225 m<sup>3</sup>/s
- The two candidate discharge locations are the 10<sup>th</sup> Line road crossing and the Winston Churchill Boulevard road crossing

The proposed effluent discharge of 0.083 m<sup>3</sup>/s is 0.8% to 1.3% of the bankfull discharge and 1.1% to 1.7% of the critical discharge, based on channel measurements and erosion threshold analyses at three sites (see **Section 4.2**). Given that sediment transport occurs almost exclusively during moderate to high flow events, once a local erosion threshold has been exceeded, it follows that channel morphology (and the

aquatic habitat it supports) is largely determined by moderate to high flows (Knighton, 1998). A relatively small increase in discharge at critical and bankfull conditions will have an unmeasurable and negligible impact on natural erosional processes along West Credit River. Furthermore, due to minimal anthropogenic disturbance and upstream urbanization, West Credit River has adopted a stable geomorphological form. Thus, there is little concern the effluent discharge will disrupt the existing dynamic equilibrium of West Credit River or exacerbate existing instabilities.

Detailed morphological data were collected immediately downstream of both candidate effluent discharge locations. Both locations are morphologically stable with no specific erosion concerns. Discharging the effluent at either location is appropriate from a fluvial geomorphological perspective. The outlet should be oriented in the downstream direction and situated on the downstream side of the chosen road crossing. The outlet will require energy dissipation measures regardless of the flow conditions in the channel. The flow dissipation can be as simple as a rip-rap splash pad, baffle features, and/or a drop-structure.

## **6 Summary and Conclusions**

PECG completed a fluvial geomorphological assessment of West Credit River between 10<sup>th</sup> Line and Winston Churchill Boulevard, in the Town of Erin, as a basis for evaluating the morphological implications of increased flow in West Credit River from a proposed WWTP. The assessment included establishing erosion thresholds and documenting existing channel processes and areas of instability. The subject reach of West Credit River is an irregular-meandering, partly confined channel that has adopted a stable cross-sectional form and pool-riffle bed morphology. The proposed effluent discharge (0.083 m<sup>3</sup>/s) will have negligible impact on erosion processes along West Credit River. The two proposed discharge locations (10<sup>th</sup> Line and Winston Churchill Boulevard) are morphologically stable with no existing erosion concerns. The outlet should be constructed in such a manner that flow is not directed towards the bed and/or bank, and some form of energy dissipation is utilized.

Dear Ms. Furlong:

We are pleased to present our Technical Memorandum for the "Wastewater Treatment Plant Site Selection" for the Urban Centre Wastewater Servicing Schedule 'C' Municipal Class Environmental Assessment (EA).

This Technical Memorandum provides a review of the Wastewater Treatment Plant (WWTP) Site Alternatives and is based on the preferred general alternative solution identified in the Servicing and Settlement Master Plan (SSMP). The Technical Memorandum establishes and evaluates alternative sites for the WWTP as a component of Phase 3 and of the Municipal Class EA process.

Yours truly,

# **Glossary of Terms**

| ACS                                   | Assimilative Capacity Study: see assimilative capacity.   |  |  |
|---------------------------------------|---|--|--|
| Ainley                                | Primary engineering consultant for the Class EA process.  |  |  |
| Alternative Solution                  | A possible approach to fulfilling the goal and objective of the study or a component of the study.  |  |  |
| Assimilative Capacity                 | The ability of receiving water (lake or river) to receive a treated effluent discharge without adverse effects on surface water quality, eco-system and aquatic life.   |  |  |
| Build-out                             | Refers to a future date where all vacant and underdeveloped lots have been fully developed in accordance with the Town's Official Plan.   |  |  |
| Class EA                              | Municipal Class Environmental Assessment, a planning process approved<br>under the EA Act in Ontario for a class or group of municipal undertakings.<br>The process must meet the requirements outlined in the "Municipal Class<br>Environmental Assessment" document (Municipal Engineers Association,<br>October 2000, as amended). The Class EA process involves evaluating the<br>environmental effects of alternative solutions and design concepts to<br>achieve a project objective and goal and includes mandatory requirements<br>for public consultation. |  |  |
| CVC                                   | Credit Valley Conservation Authority  |  |  |
| Design Concept                        | A method of implementing an alternative solution(s).  |  |  |
| EA Act                                | Environmental Assessment Act, R.S.O. 1990, c.E.18 (Ontario)   |  |  |
| Effluent                              | Liquid after treatment. Effluent refers to the liquid discharged from the WWTP to the receiving water.  |  |  |
| Environmental Protection<br>Act (EPA) |   |  |  |
| Equivalent Population                 | Equivalent Population represents Residential Population plus Institutional/<br>Commercial/Industrial wastewater flow sources expressed as the<br>equivalent number of residents, while Residential Population represents<br>the "actual" population exclusive of Institutional/ Commercial/ Industrial<br>wastewater flows.   |  |  |
| ESR                                   | Environmental Study Report, a report prepared at the culmination of Phase 4 of the Class EA process under a Schedule C planning process.  |  |  |
| Evaluation Criteria                   | Criteria applied to assist in identifying the preferred solution(s).  |  |  |
| Forcemain                             | A pressurized pipe used to convey pumped wastewater from a sewage pumping station.  |  |  |
| Geotechnical<br>Investigation         | Study of the engineering behavior of earth materials such as soil properties, rock characteristics, natural slopes, earthworks and foundations, etc.  |  |  |
| Hydrogeological                       | Study of the distribution and movement of groundwater in soil or bedrock.   |  |  |
| Master Plan                           | A comprehensive plan to guide long-term development in a particular<br>area that is broad in scope. It focuses on the analysis of a system for the<br>purpose of outlining a framework for use in future individual projects.   |  |  |
| MOECC                                 | Ministry of the Environment and Climate Change, the provincial agency   |  |  |

|                          | responsible for water, wastewater and waste regulation and approvals          |  |
|--------------------------|---|--|
|                          | and environmental assessments in Untario.                                     |  |
| MAND                     | Ministry of Natural Resources, the provincial agency responsible for the      |  |
| IVINK                    | promotion of healthy, sustainable ecosystems and the conservation of          |  |
| 08.M                     | Operation and maintenance   |  |
|                          |   |  |
|                          | The alternative solution which is the recommended course of action to         |  |
| Proferred Alternative    | meet the objective statement based on its performance under the               |  |
| Fielened Alternative     | selection criteria  |  |
|                          | lot-level or communal sewage treatment methods such as sentic systems         |  |
| Private Treatment System | or aerobic treatment systems, which remain in private ownership               |  |
| Sewage Pumping Station   | A facility containing numps to convey sewage through a forcemain to a         |  |
| (SPS)                    | higher elevation.   |  |
|                          | Criteria applied to identify the short-list of alternative solutions from the |  |
| Screening Criteria       | long-list of alternative solutions.   |  |
| Service Area             | The area that will receive sewage servicing as a result of this study.        |  |
|                          | The length of time that an infrastructure component is anticipated to         |  |
| Service Life             | remain in use assuming proper preventative maintenance.                       |  |
|                          | The liquid waste products of domestic, industrial, agricultural and           |  |
| Sewage                   | manufacturing activities directed to the wastewater colleciton system.        |  |
|                          | A plant that treats urban wastewater to remove solids, contaminants and       |  |
| Sewage Treatment Plant   | other undesirable materials before discharging the treated effluent back      |  |
| (STP)                    | to the environment. Referred to in this Class EA as a Wastewater              |  |
|                          | Treatment Plant.  |  |

## **1.0 Purpose and Study Background**

In 2014 the Town of Erin completed a Servicing and Settlement Master Plan (SSMP) to address servicing, planning and environmental issues within the urban areas of Erin Village and Hillsburgh. The aforementioned SSMP examined issues related to wastewater servicing and concluded that the preferred solution for both urban areas was a municipal wastewater collection system conveying wastewater to a single wastewater treatment plant located south east of Erin Village with treated effluent being discharged to the West Credit River.

In August of 2013, B. M. Ross concluded an Assimilative Capacity Study (ACS) establishing that a surface water discharge of treated effluent to the West Credit River was a viable alternative and suggested that the most suitable location for a WWTP outfall to the West Credit River would be situated between 10th Line and Winston Churchill Boulevard. It should be noted that the discharge from a WWTP was recommended to be located below Erin Village because of the greater assimilative capacity in this part of the river. The water quality records within this span of the river indicate lower contaminant concentrations than in other locations upstream. MOECC and CVC agreed with this approach. An update to the ACS during this UCWS Class EA study has confirmed the viability of this location and has established effluent criteria that will permit both communities to be built out to full build out of the present OP. In keeping with the recommended discharge location, the SSMP identified a general area for the location of a WWTP along Wellington County Road 52 in the area of 10th Line. Whereas the SSMP recommended preferred alternative was a single treatment plant with a capacity of 2,610 m<sup>3</sup>/d, servicing a population of 6,000 persons, this UCWS Class EA study has identified a recommended preferred alternative treatment plant with a capacity of 7,172 m<sup>3</sup>/d servicing a residential population of 14,559 persons.

The Terms of Reference for this study require that alternative sites in this area be identified and evaluated and a recommended preferred site selected. The purpose of this memorandum is to identify alternative potential locations for the WWTP and conduct a detailed evaluation to select the recommended preferred WWTP site.

## **1.1 Related Documents and Projects**

Several related studies were completed prior to the commencement of this UCWS Class EA Study and each of these studies was reviewed for pertinent information related to this project. They are described in brief in the following subsections.

## 1.2 Land Use Policies and Regulations

The following documents define the land use policies and regulations that control development within the Town of Erin.

- Provincial Policy Statement
- Greenbelt Plan
- Growth Plan for the Greater Golden Horseshoe
- County of Wellington Official Plan
- Town of Erin Official Plan
- The Town of Erin's Zoning Bylaw (No. 07-67)

The Provincial Policy Statement provides policy direction on matters of provincial interest related to land use planning and development. As a key part of Ontario's policy-led planning system, the Provincial Policy Statement sets the policy foundation for regulating the development and use of land. This

document works in tandem with locally-generated land-use planning documents with a focus on developing communities that foster a healthy environment and economic growth over the long term.

The Greenbelt is a band of permanently protected land within Ontario. The goal of the Greenbelt Plan is to protect against the loss and fragmentation of the agricultural land base and support agriculture as the predominant land use. The plan gives permanent protection to the natural heritage and water resource systems that sustain ecological and human health and provides for a diverse range of economic and social activities associated with rural communities, agriculture, tourism, recreation and resource uses. In completing the wastewater infrastructure to service the existing communities and growth designated within the Town Official Plan, through a local solution, the project is in compliance with Section 4.2 of the Greenbelt Plan.

The Growth Plan for the Greater Golden Horseshoe is a long-term plan to manage growth, build complete communities, curb sprawl and protect the natural environment. The plan sets out a structure for the type and location of development, outlines the future infrastructure needs, defines protective measures for natural and cultural resources, and provides an overarching implementation plan to achieve the stated goals.

County of Wellington Official Plan is a legal document intended to give direction over the next 20 years, to the physical development of the County, its local municipalities and to the long term protection of County resources. The plan outlines a long-term vision for Wellington County's communities and resources.

Town of Erin Official Plan is a component of the overarching County of Wellington Official Plan and details the growth allocation for Erin, planning densities, and land uses.

The Town of Erin's Zoning Bylaw (No. 07-67) provides detailed information to control the development of properties within the Town. The bylaw regulates many aspects of development, including the permitted uses of property, the location, size, and height of buildings, as well as parking and open space requirements. WWTP's are not permitted in the Town zoning bylaw which means that a zoning bylaw amendment will be required before project implementation.

## **1.3 Servicing and Settlement Master Plan (SSMP)**

The SSMP was developed by B.M. Ross and Associates Limited (2014) with the goal to develop appropriate strategies for community planning and municipal servicing, consistent with current provincial, county and municipal planning policies. The SSMP process followed the Master Plan approach, specifically Approach 1, as defined in the Municipal Class Environmental Assessment (Class EA) document, dated October 2000 (as amended in 2007 and 2011).

## 2.0 General Review of Potential WWTP Site Area

The potential location for a wastewater treatment facility was thoroughly reviewed during the 2014 SSMP and a clear rationale was established for the location along Wellington Road 52 between County Road 124 and Winston Churchill Boulevard where the assimilative capacity of the West Credit River is maximised. The location of the wastewater treatment plant identified during the SSMP was largely based on the service area, suggested wastewater collection system and the required discharge location.

The Collection System Alternatives Technical Memorandum completed as part of this UCWS Class EA study identifies a preferred collection system that conveys all wastewater to a Sewage Pumping Station at the South end of Erin Village and a forcemain from that Sewage Pumping Station that pumps all

wastewater along Wellington Road 52 towards 10th Line. The Effluent Discharge Location Technical Memorandum also completed as part of this UCWS Class EA, examines three (3) potential locations for treated effluent discharge to the West Credit River. Two locations are examined at 10<sup>th</sup> Line and one at Winston Churchill Boulevard with the preferred discharge location being located at Winston Churchill Boulevard. Wastewater from all alternative WWTP sites will therefore have to be pumped from the WWTP site.

Based on the above considerations, the lands along Wellington Road 52 between Highway 124 and Winston Churchill Boulevard with direct access of Wellington Road 52, were examined for possible sites. The lands are characterized as mildly undulating with farmlands/aggregate extraction areas to the South and the McCullough Drive/Aspen Court subdivision/farmland/large homes to the North. Elevations along Wellington Road 52 are typically between 385m and 395m above sea level. The valley of the West Credit River and tributaries to the north of the road is generally 10-15 m below this elevation. Groundwater north of Wellington Road 52 flows north to the river valley. In addition, lands to the South of Wellington Road 52 along 10<sup>th</sup> Line were examined for a potential site. An area for a possible WWTP was therefore established as follows:

- The area South of the McCulloch Drive/Aspen Court and extending 200 m east of the subdivision was eliminated due to the potential impact on the residential area and the need to create a buffer zone to meet MOECC siting criteria;
- The area North of Wellington Road 52 between 10<sup>th</sup> Line and Winston Churchill Boulevard was eliminated as it consists of private residences and the area therefore does not meet the MOECC buffer siting criteria;
- The area South of Wellington Road 52 extending from 300 m east of 10th Line to Winston Churchill Boulevard was eliminated as it could impact several private residences along the South and North side of Wellington Road 52 and not meet the MOECC buffer siting criteria;
- All lands to the North of Wellington Road 52 within CVC protected areas, including the required buffer area, were eliminated due to the potential environmental impacts;
- Lands to the South of Wellington Road 52 along 10<sup>th</sup> Line were eliminated as they are currently being operated as an aggregate extraction area and are being used as an office and processing area.

Based on the above, Figure 1 shows the area for the potential locations of the WWTP. Per the Official Plan land use designations and the Growth Plan for the Greater Golden Horseshoe, the potential site area is designated Prime Agricultural, Secondary Agricultural, Greenlands and Core Greenlands.

Figure 1 - Study Area for the potential location of the WWTP

## 3.0 Identification of Potential WWTP Sites

Having established the potential area for a WWTP site, it was necessary to determine the size of the site required to meet the effluent limits established under the ACS for a plant with a capacity of 7,172 m<sup>3</sup>/d. While the plant capacity may be revised following completion of the UCWS Class EA study in line with a new Town Official Plan, the capacity of 7,172 m<sup>3</sup>/d is seen as an ultimate capacity and typically, for long term infrastructure investments involving land purchase, it is considered prudent to purchase sufficient lands for the ultimate capacity. In addition, since this capacity represents full build out of the population including existing areas and new growth areas, it is likely that the plant will be constructed in Phases. For the purpose of this UCWS Class EA study it has been assumed that the treatment plant will be built in two phases. Within the site area, it will be necessary to reserve sufficient lands to enable construction of future phases in a safe manner without affecting operations.

Based on this, a preliminary plant layout was developed to identify the site area required. For a conventional plant with tertiary treatment constructed in two phases, it is likely that the plant areas would require approximately 150 m by 150 m of space including all of the ancillary buildings and facilities required by MOECC. The layout of this plant is shown in Figure 2.

Figure 2 – WWTP Site Selection

Siting considerations for Sewage Works are outlined in Section 3.3 of the MOECC Design Guidelines for Sewage Works (2008). These considerations include:

- To be located as far as practical from any existing commercial or residential area or any area to be developed within the plant design life
- Should be separated from adjacent uses by a buffer zone
- To be above the 100 year flood event elevation
- To have a secure boundary with access to deal with emergencies
- The site should allow for:
  - Ease of construction
  - A phased approach
  - Maintaining operation during construction
  - Planning for future additions/expansions

MOECC also places limits on air and noise emissions governed by Section 9 of the Environmental Protection Act (EPA) and must demonstrate compliance at critical receptors (eg Residences)

Separation distances between Sewage Works and sensitive land use are specified in MOECC Guideline D2 "Compatibility between Sewage Treatment and sensitive land use" intended to mitigate the effects of odour and noise. Separation distances are measured between facility structures that could generate odour or noise and the property line of a sensitive land use. For treatment plants up to a capacity of 25,000 m<sup>3</sup>/d MOECC guidelines suggest a buffer zone of 150 m and not less than 100 m.

Since the area identified for a WWTP is agricultural/aggregate extraction with few homes, it is suggested that a 5 Ha site with dimensions of 225 m by 225 m would be sufficient and would allow approximately 40 m between tanks and the property boundary of the site with the rest of the buffer zone provided by the agricultural lands and environmentally sensitive lands around the sites. While this rectangular area is used to identify the preferred areas for the WWTP, The actual site boundary would be established through discussions between the Town and the site owner at time of purchase.

Four (4) alternative sites for a WWTP have been identified for consideration and these are illustrated in Figure 3 and described below.

Figure 3 – Four Alternative Sites for WWTP

## 3.1. Alternative Sites

### 3.1.1 Alternative 1 – Solmar Site

Site 1 consists of an abandoned farmhouse and farm buildings and lands sloping down towards the West Credit River. Part of the site has been used to dispose of waste materials. Per Town of Erin Official Plan (Modified Schedule A-1), this site is located primarily in a Secondary Agricultural designation with a small portion designated as Greenlands and Core Greenlands. The site is also outside of the urban boundary

and under the current Greenbelt Plan, it cannot be developed for residential or commercial use. The site is part of a 200 acre farm property owned by Solmar Development Corporation (Solmar).

A meeting was held between the project team and Solmar to discuss the potential for use of the site as a WWTP. During the meeting, Solmar indicated that they are willing to sell sufficient property to the Town for construction of a WWTP. In fact, Solmar indicated that they had originally purchased the land for use as a WWTP site to service their development lands to the North. They had planned a discharge of treated effluent to the West Credit River. Solmar expressed no preference for where the WWTP would be located on their property, however it was agreed any potential site would be as far as possible from the existing McCullough Drive/Aspen Court subdivision and out of CVC regulated lands. This is also mostly out of the area currently under cultivation. Solmar indicated that they had not conducted any studies on the site and agreed to permit access to the project team to conduct archaeological, environmental and geotechnical studies. An agreement was executed to this effect. The results of these studies are summarised below.

Figure 4 – Site 1 (Solmar)

## **Environmental Impacts**

A natural environment assessment was carried out at sites 1 (Solmar) and 2A and 2B (HSC) during June 2017 by Hutchinson Environmental Sciences Ltd (HESL).

Two species at risk, Bobolink and Eastern Meadowlark, were detected during bird surveys of these three proposed WWTP sites. On June 1, 2017 both species were heard in the fields on sites 2A and 2B, and Eastern Meadowlark was also heard on site 1. On June 21, 2017 Bobolink and Eastern Meadowlark were only heard on Sites 2A and 2B. Site 1 appears less suitable as breeding habitat, since it is more overgrown, with scattered shrubs. The fact that an Eastern Meadowlark was heard in this field only on the first visit suggests that the species is likely not using this habitat for breeding.

Savannah Sparrow, an area sensitive species, was also recorded in the fields of all sites. Its breeding habitat is considered Significant Wildlife Habitat (Open Country Bird Breeding Habitat) because this type of habitat is declining across Ontario and North America (MNRF 2015). As such, development and site alteration are only permitted if there will be no negative impacts on the natural features or their ecological functions (MMAH 2014).

One locally rare and uncommon plant species was observed within Site 1 (Wild Geranium), while four rare and uncommon plant species were associated with the adjacent West Credit PSW complex: Yellow Sedge, Turtlehead, White Spruce, and Bristly Buttercup. The Wild Geranium can be transplanted at a location on site.

The HESL report forms part of the project documentation.

## Heritage / Archaeological Impacts

A Cultural Heritage Resource Assessment was conducted by Archaeological & Cultural Heritage Services Inc. (ASI) as part of this project. A field review of the study area was undertaken by ASI on July, 19 2017. Based on the results of this assessment, no significant impacts to cultural heritage resources is anticipated as a result of the adoption of this site for the Wastewater Treatment Plant.

A Stage 1 Archaeological Assessment of the site was conducted by ASI including a field inspection on June 22, 2017. No excavation was conducted during this inspection which concluded that the site exhibited archaeological potential. As such, the site requires a Stage 2 Archaeological Assessment by test pits prior to any proposed construction on the property.

Both ASI reports form part of the project documentation.

### Geotechnical Impacts

A geotechnical investigation was conducted by GeoPro Consulting Limited during October 2017. Four boreholes we completed to assess the suitability for construction of a WWTP. The results indicate that the site is underlain by sands and gravel deposits that provide an adequate foundation for all WWTP structures. Construction would not be impacted by groundwater or rock.

The GeoPro Consulting Limited Geotechnical Report forms part of the project documentation.

### Agricultural Impacts

This site consists of an abandoned farmhouse and farm buildings and lands sloping down towards the West Credit River. Part of the site has been used to dispose of waste materials. The site is located in a secondary agricultural zone and therefore has agricultural potential. In total the property is 200 acres with the northwestern portion of the farm property currently being rented out for crop farming on three large fields; no livestock are present at the site. The WWTP could be constructed largely to the east of the cultivated area.

The site is bounded on the west by urban development, to the north by the West Credit River. The closest property to the south is an aggregate extraction site. There are no livestock barns on the lands and it is highly unlikely that any would ever be built given the proximity to the urban area. Given the land-use in the surrounding area, development on this site would have no impact on the farming in the surrounding area.

Overall, the agricultural impact of development at this site would be limited of the loss of 5 Ha of Secondary Agricultural designated land for crop farming though this part of the property is presently not farmed.

## Cost Impacts

In order to compare the capital costs of the four (4) sites, the following was considered:

- Relative lengths of forcemain to convey wastewater to each site
- Estimated purchase cost of the site
- Costs associated with any unique development features for each site
- Costs to convey treated wastewater to the preferred outfall site.

As previously noted, all of the sites will require an inlet forcemain conveying wastewater from the collection system and an effluent pumping station to convey treated effluent to the preferred outfall site at Winston Churchill Boulevard. The inlet and outlet forcemains are the same diameter. To establish the cost of these inlet/outlet pipes relative to each site, the inlet cost was taken from a point to the west of site 1 and 2A and the outlet cost was taken to a point to the east of site 2C.

For site 1, the inlet forcemain location will be approximately the same as for site 2A (taken as zero). Outlet forcemain costs will be assumed to a common point beyond site 2C. For site 1 a cost has also been estimated to conduct necessary studies prior to purchase including and Environmental Site Assessment (ESA), Archaeological Stage 2 Study as well as clean up and demolition of the existing structures.

| Cost Component                    | Estimated Capital Cost |
|-----------------------------------|------------------------|
| Land Purchase                     | \$ 210,000             |
| Site Studies/Clean Up/Demolitions | \$ 150,000             |
| Inlet/Outlet Forcemains           | \$ 425,000             |
| Total                             | \$ 785,000             |

### 3.1.2 Alternative 2A, 2B and 2C –Halton Crushed Stone Sites

Site 2A consists of farmland on the south side of Wellington Road 52 generally opposite Site 1 and would be accessed off Wellington Road 52. Site 2B also consists of farmland at the south west corner of Wellington Road 52 and 10<sup>th</sup> Line. Site 2C consists of farmland at the south east corner of Wellington Road 52 and 10<sup>th</sup> Line. Site 2C was added for consideration after completion of the natural environment report, however, the area is similar to sites 2A and 2B and a previous environmental report (completed as part of the aggregate extraction application) covered all three sites. Per Town of Erin Official Plan (Modified Schedule A-1), these sites are located in a Prime Agricultural designation. The sites are also outside of the urban boundary and under the current Greenbelt Plan, as such, the sites cannot be developed for residential or commercial use. The sites are owned by Halton Crushed Stone (HCS), part of the Crupi Group, who have an application for extraction of sand and gravel covering all three sites, as an extension to their operation to the south of the sites.

A meeting was held between the project team and HCS to discuss the potential for use of these sites as a WWTP. During the meeting, HCS indicated that they are willing to sell sufficient property to the Town for construction of a WWTP subject to the following considerations:

- It is undesirable to HCS to sell a portion of their lands that have not been mined for the underlying aggregate resources. The lands represent an opportunity to maintain stable employment for many people. Should the Town wish to purchase the unmined lands, the value of the underlying resource would need to be taken into consideration.
- The identified sites have not been mined by HCS for their aggregate resources. The sites are within the extraction area for which HCS is in the process of obtaining approval for extraction. Based on current mining plans, it is possible the area would be actively mined for between 5 to 10 years depending on market conditions, however HCS could not confirm a schedule for extraction on the site.
- Depending on the timeline for a wastewater system, the lands could be fully mined before required by the Town, however this cannot be guaranteed by HCS.

HCS has completed extensive studies covering these sites including resource development plans, archaeological report, agricultural, natural environment report, hydrogeological report, noise report, planning report, and transportation brief. HCS made all of their reports available to the project team.

During the visit to the HCS facility the project team observed the mined and restored area. To mitigate the impact on habitat for species at risk, HCS have completed extensive restoration of mined areas. It is likely

that similar mitigation would be required if these sites are developed as a WWTP. Mitigation would likely involve setting aside lands to compensate for loss of habitat.

The sites are part of an application by HCS to extend their present operation. Their application covers some 56.7 Ha for extraction involving the recovery of some 4 to 5 million tonnes of sand and gravel at a rate of some 725,600 tonnes per year. The area represents a key sand and gravel resource generating high quality granular A and B as well as stone and sand. It would appear that the sites are underlain by up to 5 m of extractable sand and gravel.

Based on the plan to extract some 4 to 5 million tonnes over 56.7 Ha, it is reasonable to assume that a 5 Ha site would be underlain by some 400,000 tonnes of extractable sand and gravel. The commercial value of this resource is estimated at \$5/tonne (typical pick up cost for Granular B and sand in the GTA) which means that the resource under each of site 2A, 2B and 2C can be valued at \$2,000,000.

Since purchase of these sites cannot be guaranteed to meet the project timeline if they have the aggregate resource extracted, for the purpose of comparing the sites it is assumed that the Town would have to purchase the sites before extraction and therefore have to pay the commercial value of the land. In addition, since there is an active application for approval of aggregate extraction in place, the assumption that they would be mined before use as a WWTP, implies approval of the mining application.

It can also be noted that following extraction the sites are left as basically flat sites just above the groundwater table which does not make them ideal for construction of a WWTP.

Since the timeline of the project cannot be fixed with certainty, a comparison has also been completed assuming that the aggregate has been removed prior to purchase.

Figure 5 – Site 2A (HCS)

Figure 6 – Site 2B (HCS)

Figure 7 – Site 2C (HCS)

The results of field studies are summarised below.

## **Environmental Impacts**

A Level 1 and Level 2 Natural Environment Technical Report was completed in 2016 by WSP on behalf of Halton Crushed Stone as part of their application for sand and gravel extraction covering all three sites. This study identified three Provincially and Federally listed bird species at risk on the sites including the barn swallow, bobolink and eastern meadowlark. The report recommends progressive rehabilitation of habitat as the extraction proceeds to minimise the impact on these species.

A natural environment assessment was carried out at the sites during June 2017 by Hutchinson Environmental Sciences Ltd as part of the UCWS Class EA. Two species at risk, Bobolink and Eastern Meadowlark, were detected during bird surveys on sites 2A and 2B. On June 1, 2017 both species were heard in the fields on sites 2A and 2B. On June 21, 2017 Bobolink and Eastern Meadowlark were also heard on Sites 2A and 2B. Sites 2A and 2B represent potential breeding habitat for both Bobolink and Eastern Meadowlark. These species breed in grassland habitat, such as farm fields, uncut pastures and meadows. This also likely applies to site 2C.

Savannah Sparrow, an area sensitive species, was also recorded in the fields of all sites. Its breeding habitat is considered Significant Wildlife Habitat (Open Country Bird Breeding Habitat) because this type of habitat is declining across Ontario and North America (MNRF 2015). As such, development and site alteration are only permitted if there will be no negative impacts on the natural features or their ecological functions (MMAH 2014).

## Heritage / Archaeological Impacts

The sites are all owned by an aggregate extraction company who is actively seeking approval to extract aggregates from the sites. Aggregate extraction is a significant local industry and a potential source of employment in the Town.

An Archaeological assessment was completed in 2002 on all three Halton Crushed Stone sites by Archaeologix Inc. on behalf of Dufferin Aggregates application to expand the aggregate extraction area. One area with significant mid-19<sup>th</sup> Century artifacts was located close to site 2C. Stage 2 and Stage 3 Assessments were conducted at this location and a recommendation for a Stage 4 assessment was made prior to aggregate extraction.

A Cultural Heritage Resource Assessment was conducted by Archaeological & Cultural Heritage Services Inc. (ASI) as part of this project. A field review of the study area of sites 2A and 2B was undertaken by ASI on July, 19 2017. Based on the results of this assessment, no significant impacts to cultural heritage resources is anticipated as a result of the adoption of sites 2A or 2B for the Wastewater Treatment Plant.

The ASI report forms part of the project documentation.

### Geotechnical Impacts

The sites are underlain by sand and gravel which is being extracted to just above the water table. Prior to extraction it is anticipated that the soils would provide excellent foundation materials with little requirement for a "Permit to Take Water" for construction dewatering or for structures to counteract buoyancy forces. Following extraction of the aggregates it is likely that dewatering would be required during construction and structures would need to have increased weight to counteract buoyancy. Alternatively they could be constructed above the water table and the site refilled.

## Agricultural Impacts

Currently the site consists partially of agricultural land with a single detached dwelling and a gravel quarry operation with all the necessary appurtenances. A portion of the site is currently zoned for aggregate extraction and the remainder is zoned for agriculture. The lands are relatively flat with a gradual slope towards the north end of the site. The subject lands are actively farmed with a mixture of rye, oat and hay; no livestock are present at the site. The lands are recognized as a Prime Agricultural area based on the County and Town Official Plans and within the Growth Plan for the Greater Golden Horseshoe. According to updated soils mapping from OMAFRA, the subject lands contain Class 1 soils (Caledon Fine Sandy Loam).

Soil drainage is identified as "Good" with a low potential for soil compaction. The topographic class is "Smooth very gently sloping" and the stoniness class is "Stonefree". The existing pit is being progressively rehabilitated back to agricultural uses. The rehabilitated lands are actively farmed and managed as a hay field.

The site is bounded on the south and east by the rural area intermixed with woodlands. There are no livestock barns on the lands and it is highly unlikely that any would ever be built given the proximity to the urban area. Given the land-use in the surrounding area, development on this site may have a limited impact on the agricultural activities in the surrounding area. The proposed treatment facility would have regular truck traffic bringing septage to the site and could interfere with the movement of agricultural equipment. Given that the site is currently used for aggregate extraction, the impact of a WWTP would be substantially reduced in comparison to the current use.

The direct agricultural impact of development at this site would be limited of the loss of 5 Ha of Prime Agricultural designated land for crop farming.

## Cost Impacts

Below, estimated capital costs and advantages/disadvantages are shown for each of the three Halton Crushed Stone sites both before and after resource extraction.

For site 2A, the inlet forcemain location will be approximately the same as for site 1. Table 3 shows the relative length of the inlet and outlet forcemains. The cost of land purchase is assumed to be the same as for site 1 based on agricultural use. It is assumed that the Town would also have to pay for the aggregate resource.

| Cost Component               | Estimated Capital Cost |
|------------------------------|------------------------|
| Land Purchase                | \$ 210,000             |
| Value of Aggregate Resources | \$ 2,000,000           |
| Inlet/Outlet Forcemains*     | \$ 455,000             |
| Total                        | \$ 2,665,000           |

### Table 3 - Site 2A Estimated Capital Cost Prior to Resource Extraction

### Table 4 - Advantages and Disadvantages of Site 2A

| Advantages  | Disadvantages  |
|---|--|
| <ul> <li>Sufficient space is available for the WWTP immediately adjacent Wellington Road 52.</li> <li>The WWTP can be constructed more than 200 m from any residences.</li> </ul> | <ul> <li>Site topography may not provide adequate space to support gravity flow through the WWTP as elevations drop off considerably to the west.</li> <li>The site is mainly at a high elevation and the site would be highly visible.</li> <li>Species at risk have been identified on the site and any development may require habitat</li> </ul> |
|   | <ul> <li>Additional land purchase may be needed for habitat compensation.</li> <li>An entrance permit onto Wellington Road 52 will be necessary from the County.</li> <li>Would result in up to 5 Ha of prime agricultural lands being impacted.</li> <li>Will require a zoning bylaw amendment to permit construction of the WWTP.</li> </ul>       |

### Table 5 - Site 2A Estimated Capital Cost Following Resource Extraction

| Cost Component          | Estimated Capital Cost |
|-------------------------|------------------------|
| Land Purchase           | \$ 210,000             |
| Inlet/Outlet Forcemains | \$ 455,000             |
| Total                   | \$ 665,000             |

It is assumed that in purchasing the lands for the WWTP site following resource extraction, HCS would have already provided rehabilitation compensation for the species at risk over their other lands.

It should also be noted that, following extraction, the flat site just above the groundwater table will add to the cost of construction both in terms of having to provide considerable dewatering within sand and gravel during construction and in additional structural weight (concrete) to offset the effects of buoyancy when constructing tanks below the groundwater table. Alternatively the facilities could be constructed above the water table on imported fill which would also add to cost.

### Table 6 - Advantages and Disadvantages of Site 2A Following Resource Extraction

| Advantages  | Disadvantages  |
|---|--|
| <ul> <li>Sufficient space is available for the WWTP<br/>immediately adjacent Wellington Road 52.</li> </ul>   | <ul> <li>Site topography will be flat following<br/>aggregate extraction which does not support<br/>arguity flow through plant</li> </ul>  |
| <ul> <li>The WWTP can be constructed more than 200 m from any residences.</li> <li>The plant could be hidden from view in the extracted area</li> </ul> | <ul> <li>Gravity now through plant.</li> <li>Construction may be affected by the groundwater table which can add to costs for dewatering and structural work.</li> <li>HCS cannot provide a date when the</li> </ul> |

| Advantages | Disadvantages   |
|------------|---|
|            | resource extraction will be completed and so<br>this alternative does not provide a valid<br>solution at this time. |
|            | <ul> <li>Would result in up to 5 Ha of prime<br/>agricultural lands being impacted.</li> </ul>                      |
|            | <ul> <li>Will require a zoning bylaw amendment to<br/>permit construction of the WWTP.</li> </ul>                   |

For site 2B, the inlet forcemain location will be longer than for site 1 and 2A, however the outlet forcemain would be shorter and effluent would still require pumping. The cost of land purchase is assumed to be the same as for site 1 based on agricultural use. It is assumed that the Town would also have to pay for the aggregate use.

### Table 7 - Site 2B Estimated Capital Cost Prior to Resource Extraction

| Cost Component               | Estimated Capital Cost |
|------------------------------|------------------------|
| Land Purchase                | \$ 210,000             |
| Value of Aggregate Resources | \$ 2,000,000           |
| Inlet/Outlet Forcemains      | \$ 440,000             |
| Total                        | \$ 2,650,000           |

| Table 8 - Advantages | and Disadvantages | of Site 2B Prior to | Resource Extraction |
|----------------------|-------------------|---------------------|---------------------|
|                      |                   |                     |                     |

| Advantages   | Disadvantages   |
|--|---|
| <ul> <li>Sufficient space is available for the WWTP<br/>immediately with an access off 10th Line.</li> </ul>   | <ul> <li>HCS may wish to mine 10th Line which could<br/>affect access or outlet forcemain design.</li> </ul>  |
| <ul> <li>The elevations across the site are adequate to<br/>support design of gravity flow through the WWTP.</li> </ul>  | <ul> <li>Species at risk have been identified on the site.</li> <li>Additional land purchase may be needed for</li> </ul>   |
| <ul> <li>Topography will allow the main plant processes to be partly hidden from Wellington Road 52.</li> <li>The WWTP can be constructed more than 200 m from any residences and represents the site with the greatest buffer zone</li> </ul> | <ul> <li>Would result in up to 5 Ha of prime agricultural lands being impacted.</li> <li>Will require a zoning bylaw amendment to permit construction of the WWTP.</li> </ul> |

### Table 9 - Site 2B Estimated Capital Cost Following Resource Extraction

| Cost Component          | Estimated Capital Cost |
|-------------------------|------------------------|
| Land Purchase           | \$ 210,000             |
| Inlet/Outlet Forcemains | \$ 440,000             |
| Total                   | \$ 650,000             |

### Table 10 - Advantages and Disadvantages of Site 2B Following Resource Extraction

| Advantages  | Disadvantages  |
|---|--|
| <ul> <li>Sufficient space is available for the WWTP<br/>immediately with an access off either Wellington<br/>Road 52 or 10th Line.</li> </ul>   | <ul> <li>Site topography will be flat following aggregate<br/>extraction which does not support gravity flow<br/>through plant.</li> </ul>                                       |
| <ul> <li>The plant could be hidden from view in the extracted area.</li> <li>The WWTP can be constructed more than 200 m from any residences and represents the site with the greatest buffer zone</li> </ul> | <ul> <li>Construction may be affected by the groundwater<br/>table which can add to costs for dewatering and<br/>structural work.</li> </ul>                                     |
|   | <ul> <li>HCS cannot provide a date when the resource<br/>extraction will be completed and so this<br/>alternative does not provide a valid solution at this<br/>time.</li> </ul> |
|   | <ul> <li>Would result in up to 5 Ha of prime agricultural<br/>lands being impacted.</li> </ul>   |
|   | <ul> <li>Will require a zoning bylaw amendment to permit<br/>construction of the WWTP.</li> </ul>  |

For site 2C, the inlet forcemain location will be longer than for site 1 and 2A/2B, however the outlet forcemain would be shorter and effluent would still require pumping. The cost of land purchase is assumed to be the same as for site 1 based on agricultural use. It is assumed that the Town would also have to pay for the aggregate use prior to extraction.

### Table 11 - Site 2C Estimated Capital Cost Prior to Resource Extraction

| Cost Component               | Estimated Capital Cost |
|------------------------------|------------------------|
| Land Purchase                | \$ 210,000             |
| Value of Aggregate Resources | \$ 2,000,000           |
| Inlet/Outlet Forcemains      | \$ 460,000             |
| Total                        | \$ 2,670,000           |

### Table 12 - Advantages and Disadvantages of Site 2C Prior to Resource Extraction

| Advantages   | Disadvantages   |
|--|---|
| <ul> <li>Sufficient space is available for the WWTP immediately with an access off 10th Line.</li> <li>The elevations across the site are adequate to support design of gravity flow through the WWTP.</li> <li>The WWTP can be constructed more than 200 m from any residences and represents the site with the greatest buffer zone</li> </ul> | <ul> <li>HCS may wish to mine 10th Line which could affect access or outlet forcemain design.</li> <li>Species at risk have been identified on the site</li> <li>Additional land purchase may be needed for habitat compensation.</li> <li>Topography and location make this a fairly visible site that will not allow the main plant processes to be hidden from Wellington Road 52 unless berms are constructed.</li> <li>An archaeological site has been identified close to this site.</li> <li>The site is closer to residences on Wellington</li> </ul> |
|  |   |

| Advantages | Disadvantages   |

|   | <ul> <li>HCS cannot provide a date when the resource extraction will be completed and so this alternative does not provide a valid solution at this time.</li> <li>Would result in up to 5 Ha of prime agricultural lands being impacted.</li> <li>Will require a zoning bylaw amendment to permit construction of the WWTP.</li> </ul> |

## 4.0 Evaluation Methodology

The evaluation methodology used to select the preferred solution for the WWTP site was established in a manner consistent with the principles of environmental assessment planning and decision-making as outlined in Municipal Class Environmental Assessment.

A decision model consistent with the principles of environmental assessment planning and decision making as outlined in Municipal Class Environmental Assessment manual was developed to select the preferred site.

Since the sites are all in a similar area and have similar characteristics, specific evaluation criteria were identified and compared distinguishing features between the sites. Whereas other components of the UCWS Class EA place a higher emphasis on Technical Criteria, for the site selection evaluation, Environmental and Economic Criteria play a more important role.

Based on the above, the four (4) Alternative Sites (Site 1, 2A, 2B and 2C) will be evaluated against the specific evaluation criteria described in the Table 15 below:

| Primary Criteria | Weight | Secondary Criteria                          | Weight |
|------------------|--------|---|--------|
| Social/Culture   | 15%    | Impacts During Construction                 | 20%    |
|                  |        | Aesthetics                                  | 30%    |
|                  |        | Effect on Residential Properties            | 30%    |
|                  |        | Effect on Businesses/ Commercial Properties | 10%    |
|                  |        | Effect on Industrial Properties             | 10%    |
| Technical        | 10%    | Suitability of Elevation and Topography     | 50%    |
|                  |        | Suitability for Phasing                     | 20%    |
|                  |        | Construction Impacts                        | 20%    |
|                  |        | Operation and Maintenance Impacts           | 10%    |
| Economic         | 25%    | Capital Cost                                | 30%    |
| Environmental    | 50%    | Effect on Habitat/ Wildlife                 | 30%    |
|                  |        | Effect on Vegetation/ Wetlands              | 30%    |
|                  |        | Effect on Groundwater                       | 20%    |
|                  |        | Effect on Surface Water/ Fisheries          | 20%    |

Table 15 - WWTP Site Evaluation Criteria

### 4.1. Screening Criteria Definitions

### 4.1.1 Social/Culture, Impacts During Construction

This criterion captures the level of disturbance to the community the proposed solution will have during the construction period. These effects include noise levels, vibration, odours, dust production, as well as the amount of time for which these disturbances will persist.

### 4.1.2 Social/Culture, Aesthetics

This criterion captures the level of impact from the visual appearance of the plant on local residents and traffic on Wellington Road 52.

### 4.1.3 Social/Culture, Effect on Residential Properties

This criterion captures the level of impact that establishing and maintaining a WWTP on the site, has on individual residential properties. Impacts considered include, traffic (septage receiving, chemicals and other deliveries as well as sludge haulage), lighting, odour and noise from the operating plant.

### 4.1.4 Social/Culture, Effect on Commercial Properties

This criterion captures the level of impact that establishing and maintaining a WWTP on the site, has on individual commercial properties. Impacts considered include, traffic (septage receiving, chemicals and other deliveries as well as sludge haulage), lighting, odour and noise from the operating plant.

### 4.1.5 Social/Culture, Effect on Industrial Properties

This criterion captures the level of impact that establishing and maintaining a WWTP on the site has on individual industrial properties. Impacts considered include, traffic (septage receiving, chemicals and other deliveries as well as sludge haulage), lighting, odour and noise from the operating plant.

### 4.1.6 Technical, Suitability of Elevation and Topography

Typically the flow through WWTP processes is by gravity. Wastewater will be pumped to the WWTP and effluent will be pumped to the West Credit River at Winston Churchill Boulevard. The elevation and topography of potential sites therefore impacts the suitability of the site.

### 4.1.7 Technical, Suitability for Phasing

This criterion captures the capacity of the WWTP to be expanded under a phased development plan. Sites that allow flexibility in WWTP development to promote ease of expansion would have a lower impact on expandability.

### 4.1.8 Technical, Construction Impacts

This criterion captures the constructability of the WWTP on the potential sites. This would include geotechnical aspects and hydrogeological aspects affecting structural design of the WWTP.

### 4.1.9 Technical, Operational and Maintenance Impacts

This criterion captures the impacts of each site on the operability of the WWTP. This would take into consideration, access to the site, ability to deal with weather events, prevailing winds, potential for flooding and level of effort required by operations staff to operate and maintain the system on the site.

### 4.1.10 Economic, Capital Cost

For upfront purchase of lands to construct the WWTP the main issue is capital cost. There is minimal ongoing cost associated with the WWTP site. Site comparison is presented on the basis of relative capital costs for each site. All sites will have a similar cost for earthworks, landscaping and plant development not included in the comparative analysis

### 4.1.11 Environmental, Effect on Habitat/ Wildlife

The criterion captures the impact that the establishment and operation of the site has on the local habitat and wildlife both during construction and over the long term. Minimizing negative impacts of the local habitat and wildlife is rated favourably.

### 4.1.12 Environmental, Effect on Vegetation/ Wetlands

The criterion captures the impact that the establishment and operation of the site has on the local vegetation and wetlands both during construction and over the long term. Minimizing negative impacts on the local vegetation and wetlands is rated favourably. Agricultural impacts are also captured under this category.

### 4.1.13 Environmental, Effect on Groundwater

The criterion captures the level of groundwater impacts associated with the site and proximity to source water protection zones. Minimizing contamination of the local groundwater is rated favourably.

### 4.1.14 Environmental, Effect on Surface Water/ Fisheries

The criterion captures the impact that the establishment and operation of the site has on the local surface waters both during construction and over the long term. Minimizing contamination of the local surface water is rated favourably.

## **5.0 Evaluation of Alternatives Sites**

### 5.1. Detailed Evaluation of Site Alternatives

The evaluation of the four (4) potential WWTP sites, using the criteria and weightings listed in Table 15 was completed based on:

- The present site conditions prior to resource extraction. The evaluation is provided in Table 16.
- The site conditions following resource extraction. The evaluation is provided in Table 17.

Based on detailed evaluation of the alternatives, Site No 1 (Solmar) has the highest score prior to resource extraction and is identified as the preferred alternative based on present site conditions. Following resource extraction, Site 2B (HCS) has the highest score and is identified as the preferred alternative following resource extraction.

The details of the scoring and rationale have been provided in Table 18.

Table 17 – Evaluation Matrix for Short Listed Wastewater Treatment Plant Site Alternatives (Following Aggregate Extraction)

Based on the above evaluation, Site 2B (HCS) is the preferred site following aggregate extraction.

### Table 18 – Criteria Rating Rationale

| Criteria  | Site 1 (Solmar)  | Site 2A (HCS)  | Site 2B (HCS)  | Site 2C (HCS)  |
|---|--|--|--|--|
| Social/ Culture -<br>Impacts During<br>Construction | <ul> <li>It is anticipated that the site is sufficiently remote from the existing community that the effects of dust, noise, will not impact the community to any great degree</li> <li>Traffic impact can be mitigated by specifying haul routes and likely can avoid urban areas</li> <li>Stage 2 Archaeological Study required</li> </ul> | <ul> <li>Same as site 1</li> <li>Similar impacts after aggregate extraction</li> </ul>   | <ul> <li>Same as site 1</li> <li>Development of site 2B on 10<sup>th</sup> Line may impact access to HCS operations</li> <li>Similar impacts after aggregate extraction</li> </ul>   | <ul> <li>Same as site 1</li> <li>Development of site 2C on 10<sup>th</sup> Line may impact access to HCS operations</li> <li>Similar impacts after aggregate extraction</li> <li>Potential for additional archaeological resources to be found</li> </ul>  |
| Social/ Culture -<br>Aesthetics                     | <ul> <li>Due to the site sloping to the north it will be possible to minimize impact from Wellington Road 52</li> <li>The subdivision to the west will likely be completely hidden from the WWTP</li> </ul>  | <ul> <li>The site is at the highest<br/>elevation in the area and it<br/>would likely be highly<br/>visible from Wellington<br/>Road 52 and from the<br/>subdivision to the west</li> <li>This site would have a<br/>significant aesthetic<br/>impact despite attempts to<br/>mitigate through<br/>landscaping and planting</li> <li>Following extraction the<br/>site would be less visible<br/>but still likely in view of<br/>road</li> </ul> | <ul> <li>This site has the potential to have the least aesthetic impact on the area</li> <li>Natural topography can shield the WWTP from Wellington Road 52 and the subdivision to the west</li> <li>It would have a small aesthetic impact on homes to the east of 10<sup>th</sup> Line</li> <li>Following extraction would be even less visible</li> </ul> | <ul> <li>The site is at the corner of Wellington Road 52 and 10<sup>th</sup> Line and visible from both roads and to homes to the east</li> <li>This site would have an aesthetic impact despite attempts to mitigate through landscaping and planting</li> <li>Following extraction the site would be less visible but still likely in view of roads</li> </ul> |
| Social/ Culture - Effect<br>on Residential          | <ul> <li>This site could potentially<br/>impact the McCullough</li> </ul>  | <ul> <li>This site could potentially<br/>impact the McCullough</li> </ul>  | <ul> <li>This site would potentially<br/>have little impact on</li> </ul>  | <ul> <li>This site could potentially<br/>impact several homes to</li> </ul>  |

| Criteria   | Site 1 (Solmar)   | Site 2A (HCS)  | Site 2B (HCS)   | Site 2C (HCS)   |
|--|---|--|---|---|
| Properties   | <ul> <li>Drive/Aspen Court<br/>subdivision and a single<br/>home on 10<sup>th</sup> Line</li> <li>Buffer distances exceed<br/>MOECC recommended<br/>distances and additional<br/>mitigation can be put in place<br/>to comply with noise and<br/>odour limitations</li> <li>Prevailing winds are away<br/>from the subdivision</li> </ul> | <ul> <li>Drive/Aspen Court<br/>subdivision</li> <li>Buffer distances exceed<br/>MOECC recommended<br/>distances and additional<br/>mitigation can be put in<br/>place to comply with noise<br/>and odour limitations</li> <li>Prevailing winds are away<br/>from the subdivision</li> <li>Aggregate extraction<br/>would not significantly<br/>change potential impacts</li> </ul> | <ul> <li>residential developments.</li> <li>Buffer distances exceed<br/>MOECC recommended<br/>distances and additional<br/>mitigation can be put in<br/>place to comply with noise<br/>and odour limitations.</li> <li>Prevailing winds are away<br/>from the subdivision</li> <li>Aggregate extraction would<br/>not significantly change<br/>potential impacts</li> </ul> | <ul> <li>the east</li> <li>Buffer distances exceed<br/>MOECC recommended<br/>distances and additional<br/>mitigation can be put in<br/>place to comply with noise<br/>and odour limitations</li> <li>Prevailing winds are<br/>generally in the direction of<br/>the homes on the south<br/>side of Wellington Road 52</li> <li>Aggregate extraction would<br/>not significantly change<br/>potential impacts</li> </ul> |
| <b>Social/ Culture -</b> Effect<br>on Businesses/<br>Commercial Properties | <ul> <li>There are few commercial<br/>businesses within the area of<br/>the site and a WWTP on this<br/>site would have little impact<br/>on commercial properties</li> </ul>   | <ul> <li>Same as site 1</li> </ul>   | <ul> <li>Same as site 1</li> </ul>  | <ul> <li>Same as site 1</li> </ul>  |
| Social/ Culture - Effect<br>on Industrial Properties                       | <ul> <li>There are no industrial<br/>businesses within the area of<br/>the site and a WWTP on this<br/>site would have little impact<br/>on industrial properties</li> </ul>  | <ul> <li>The site is zoned for<br/>aggregate extraction and<br/>development of this site<br/>prior to extraction, would<br/>negatively impact the<br/>commercial value of the<br/>site</li> </ul>  | <ul> <li>Same as 2A</li> </ul>  | <ul> <li>Same as 2A</li> </ul>  |
| <b>Technical -</b> Suitability<br>of Elevation and<br>Topography           | <ul><li>Site 1 is sufficiently above the river and flood level.</li><li>Site 1 provides topography</li></ul>  | <ul> <li>Site 2A is sufficiently<br/>above the river and flood<br/>level.</li> </ul>   | <ul> <li>Site 2B is sufficiently above<br/>the river and flood level.</li> <li>Site 2B provides topography</li> </ul>   | <ul> <li>Site 2C is sufficiently above<br/>the river and flood level.</li> <li>Site 2C provides</li> </ul>  |

| Criteria   | Site 1 (Solmar)   | Site 2A (HCS)   | Site 2B (HCS)   | Site 2C (HCS)  |
|--|---|---|---|--|
|  | <ul> <li>sloping to the north sufficient<br/>to maintain gravity flow<br/>through all of the treatment<br/>processes while screening<br/>them from the road.</li> <li>Site will need to have debris<br/>cleaned from the site prior to<br/>construction.</li> </ul>   | <ul> <li>Site 2A provides<br/>topography sloping to the<br/>south sufficient to maintain<br/>gravity flow through all of<br/>the treatment processes</li> <li>Aggregate extraction<br/>would result in a flat site<br/>just above the<br/>groundwater table making<br/>it more costly to construct<br/>the plant</li> </ul> | <ul> <li>sloping to the south east<br/>sufficient to maintain gravity<br/>flow through all of the<br/>treatment processes while<br/>screening them from the<br/>road.</li> <li>Same as site 2A</li> </ul> | <ul> <li>topography sloping to the south east sufficient to maintain gravity flow through all of the treatment processes</li> <li>Same as site 2A</li> </ul> |
| <b>Technical -</b> Suitability for Phasing                 | <ul> <li>Site supports phasing as<br/>shown in figure 2</li> </ul>  | <ul> <li>Site supports phasing as<br/>shown in figure 2</li> </ul>  | <ul> <li>Site supports phasing as<br/>shown in figure 2</li> </ul>  | <ul> <li>Site supports phasing as<br/>shown in figure 2</li> </ul>   |
| <b>Technical -</b><br>Construction Impacts                 | <ul> <li>Construction traffic flow to the site should not have a major impact on the community</li> <li>Site is sufficiently far from residential properties that dust and noise should not impact them</li> <li>The soils underlying the site form adequate foundation material and avoid added cost of dewatering and rock removal</li> </ul> | <ul> <li>As site 1</li> <li>Aggregate removal to just<br/>above the water table will<br/>add to the construction<br/>cost</li> </ul>  | <ul> <li>As site 1</li> <li>Aggregate removal to just<br/>above the water table will<br/>add to the construction cost</li> </ul>  | <ul> <li>As site 1</li> <li>Aggregate removal to just<br/>above the water table will<br/>add to the construction cost</li> </ul>                             |
| <b>Technical -</b> Operation<br>and Maintenance<br>Impacts | <ul> <li>Site has good access for<br/>deliveries, maintenance and<br/>dealing with emergencies</li> <li>Sufficient space to</li> </ul>  | <ul> <li>As site 1</li> <li>Aggregate removal will<br/>detract from site access</li> </ul>  | <ul> <li>As site 1</li> </ul>   | <ul> <li>As site 1</li> <li>Aggregate removal will<br/>detract from site access</li> </ul>   |

| Criteria  | Site 1 (Solmar)   | Site 2A (HCS)   | Site 2B (HCS)   | Site 2C (HCS)   |
|---|---|---|---|---|
|   | <ul> <li>accommodate all MOECC<br/>requirements</li> <li>The elevation and slope of<br/>the site should be able to<br/>deal with design weather<br/>events</li> </ul>   |   |   |   |
| <b>Economic -</b> Capital<br>Cost                     | <ul> <li>This site has the least capital cost prior to aggregate extraction</li> <li>The Owner of the site is willing to sell the site to meet the project schedule</li> </ul>  | <ul> <li>Sites 2A, 2B and 2C have<br/>a similar cost prior to<br/>extraction which is<br/>substantially higher than<br/>site 1 cost</li> <li>The Owner of the site is<br/>not willing to sell the site<br/>to meet the project<br/>schedule, however would<br/>be willing to sell the site<br/>after mining which would<br/>lower the capital cost</li> <li>Following aggregate<br/>extraction the site is likely<br/>less costly to purchase but<br/>more costly to develop</li> </ul> | <ul> <li>Sites 2A, 2B and 2C have a similar cost prior to extraction which is substantially higher than site 1 cost</li> <li>The Owner of the site is not willing to sell the site to meet the project schedule, however would be willing to sell the site after mining which would lower the capital cost</li> <li>Following aggregate extraction the site is likely less costly to purchase but more costly to develop</li> </ul> | <ul> <li>Sites 2A, 2B and 2C have a similar cost prior to extraction which is substantially higher than site 1 cost</li> <li>The Owner of the site is not willing to sell the site to meet the project schedule, however would be willing to sell the site after mining which would lower the capital cost</li> <li>Following aggregate extraction the site is likely less costly to purchase but more costly to develop</li> </ul> |
| <b>Environmental -</b> Effect<br>on Habitat/ Wildlife | <ul> <li>Each of the four proposed<br/>WWTP site locations<br/>contained sensitive features</li> <li>Two threatened bird species<br/>observed on site but not<br/>considered to be breeding on<br/>site</li> <li>Provides wildlife habitat for<br/>an area sensitive grassland</li> </ul> | <ul> <li>Each of the four proposed<br/>WWTP site locations<br/>contained sensitive<br/>features</li> <li>Two threatened bird<br/>species observed on site<br/>and considered to be<br/>breeding on site</li> <li>Mitigation to protect</li> </ul>   | <ul> <li>Each of the four proposed<br/>WWTP site locations<br/>contained sensitive features</li> <li>Two threatened bird species<br/>observed on site and<br/>considered to be breeding<br/>on site</li> <li>Mitigation to protect<br/>threatened species must be</li> </ul>  | <ul> <li>Each of the four proposed<br/>WWTP site locations<br/>contained sensitive<br/>features</li> <li>Two threatened bird<br/>species observed on site<br/>and considered to be<br/>breeding on site</li> <li>Mitigation to protect</li> </ul>   |

## 6.0 Conclusion and Recommendations

- The 2014 Servicing and Settlement Master Plan (SSMP) identified a general area for the WWTP south east of Erin Village.
- The UCWS EA is a continuation of the Class EA process and aims to establish the preferred design alternative for the wastewater system servicing Erin Village and Hillsburgh.
- The updated Assimilative Capacity study completed for the UCWS Class EA study confirmed the suitability of the general WWTP site area identified in the SSMP.
- The Wastewater Collection System Alternatives Technical Memorandum confirmed that all wastewater can be conveyed to the area.
- The Outfall Alternatives Technical Memorandum confirms that Winston Churchill Boulevard is the preferred effluent discharge location from the WWTP requiring effluent to be pumped from all of the candidate sites to the outfall location.
- MOECC requirements for WWTP siting were examined and used to assist in defining potential sites.
- An assessment of site space requirements was conducted and a site area of 5 Hectares was identified sufficient for the plant facilities and a buffer zone in excess of MOECC requirements including the agricultural/Wetland areas around the site.
- Based on the above and a more detailed examination of the area, this UCWS Class EA study has
  refined the general area for the WWTP and selected four (4) sites within this area as being suitable for
  a WWTP site.
- The four (4) sites are defined as follows:
  - Site 1 Solmar site
  - Site 2A Halton Crushed Stone (HCS) site
  - Site 2B Halton Crushed Stone (HCS) site
  - Site 2C Halton Crushed Stone (HCS) site
- The project team met with the Owners of the sites and secured permission to conduct studies to support the decision making process. Studies completed by HCS were provided to the project team.
- As a result of these Owner meetings, Solmar (site 1) indicated that they would support sale of part of their land for a WWTP site and HCS (sites 2A, 2B and 2C) indicated that they would support the sale of their property only after the aggregate resources were mined and the site restored to agricultural use.
- The team compiled sufficient information on the environmental, geotechnical, archaeological and costing aspects of the sites to support an evaluation process aimed at selecting the preferred site.
- The evaluation criteria were established with the following weighting for the primary criteria:
  - Social/ Cultural Impacts 15%
  - Technical Impacts 10%
  - Economic Impacts– 25%
  - Environmental Impacts 50%
- Environmental impacts are summarized as follows:

Each of the four proposed WWTP site locations contained sensitive features.

Several threatened species of birds were found on all sites. Bobolink and Eastern Meadowlark are threatened species under Ontario's Endangered Species Act. As such, certain provisions apply to development that will damage or destroy the habitat of these birds. No permit is required if the area to be developed is equal to or less than 30 hectares, but the following rules must be followed:

- The work and affected species must be registered with the MNRF before the work begins;
- A habitat management plan must be prepared and followed;
- Habitat for the affected species must be created or enhanced, and managed;
- A written undertaking must be submitted to MNRF indicating that any habitat created or enhanced will be managed over time;
- No activity likely to damage or destroy habitat, or kill, harm or harass individuals of the affected
- species will be carried out between May 1 and July 31;
- Reasonable steps will be taken to minimize adverse effects on the affected species (e.g., locating
  access routes outside of the birds' habitat);
- Records relating to the work and habitat must be prepared and maintained; and
- Sightings of rare species must be reported (and registration documents updated, as needed).

The WWTP site locations were evaluated based on presence of provincially and/or nationally designated SAR, sensitive bird species, and significant habitat. The screening criteria indicated that Site 1 (Solmar) is the preferred choice for the location of the WWTP site, based on the presence of two species at risk in suitable breeding habitat on the other sites (HCS). However, Site 1 does provide suitable breeding habitat for the area sensitive Savannah Sparrow, and thus qualifies as Significant Wildlife Habitat under the PPS. As such, development and site alteration are only permitted if there will be no negative impacts on the natural features or their ecological functions. Furthermore, Site 1 contained a rare and uncommon plant species (Wild Geranium), and is located next to the West Credit PSW Complex. Appropriate mitigation measures were therefore recommended to ensure no negative effects on species of conservation concern and important natural heritage features in the vicinity.

Geotechnical impacts are summarized as follows:

All sites are generally suitable for construction of a WWTP. Prior to aggregate extraction, the sites provide good foundation materials well above the groundwater table which will minimize the need to dewater excavations during construction. Following aggregate extraction, the HCS sites will be just above the water table which would require dewatering during excavation or otherwise importing materials and building all facilities above the water table.

Archaeological impacts are summarized as follows:

An archaeological investigation of Site 1 (Solmar) indicated the potential for archaeological resources to be found on site. A stage 2 investigation is recommended prior to site development.

An archaeological investigation (Stage 1, 2 and 3) has been completed for Sites 2A, 2B and 2C (HCS). An archaeological site was located close to site 2C leaving the potential for additional resources to be located on Site 2C.

• The relative capital costs for each site are summarized as follows:

| Alternative     | Capital Cost Prior to<br>Aggregate extraction | Capital Cost Following<br>Aggregate extraction |
|-----------------|---|--|
| Site 1 (Solmar) | \$ 785,000                                    | \$ 785,000                                     |
| Site 2A (HCS)   | \$ 2,665,000                                  | \$ 665,000                                     |
| Site 2B (HCS)   | \$ 2,650,000                                  | \$ 650,000                                     |
| Site 2C (HCS)   | \$ 2,670,000                                  | \$ 670,000                                     |

- The results of the evaluation process indicate that, prior to aggregate extraction, Site 1 has the highest score and is preferred over sites 2A, 2B or 2C.
- The primary reasons for this are:
  - The site owner is willing to sell the land to meet the project schedule
  - The high capital cost difference between Site 1 and Site 2A 2B and 2C which includes the resource cost for the aggregate extraction
  - The effect on the industrial sector of reducing the area for aggregate extraction
  - Aesthetics of developing a WWTP on site 2A
  - Less environmental impact on Site 1
- Based on the above, prior to aggregate extraction, it is recommended that Site 1 (Solmar) be carried forward as the preferred site for the WWTP.
- The results of the evaluation process **following aggregate extraction**, indicate that Site 2B has the highest score and is preferred over sites 1, 2A or 2C.
- The primary reasons for this are:
  - The site provides the best buffer from all nearby residences
  - The site can be hidden almost completely from view from all residences and Wellington Road 52
  - Less environmental impact following extraction assuming that HCS have mitigated the loss of habitat
- It is noted that all of the necessary studies
- It Based on the above, if aggregate extraction takes place prior to the Town requiring the site for the project then it is recommended that Site 2B (HCS) be carried forward as the preferred site for the WWTP.
- In carrying forward two treatment plant sites as possible locations for the WWTP through to the final ESR it is recognized that the municipality will need to prepare an Addendum to the ESR to make a final site selection and this addendum will need to fully explain the events that have occurred and the rationale for making the final location decision.

#### Attn: Christine Furlong, P.Eng. Project Manager

#### Ref: Town of Erin, Urban Centre Wastewater Servicing Class EA Treatment Technology Alternatives, Technical Memorandum

Dear Ms. Furlong:

We are pleased to present the Technical Memorandum for the "Treatment Technology Alternatives" for the Urban Centre Wastewater Servicing Schedule 'C' Municipal Class Environmental Assessment (EA).

This Technical Memorandum provides a review of the Treatment Technology Alternatives and includes those alternatives identified in the Servicing and Settlement Master Plan (SSMP). The Technical Memorandum establishes and evaluates alternative for the wastewater treatment system as a component of Phase 3 of the Municipal Class EA process. The recommended preferred Alternative is presented in the Technical Memorandum which will remain in draft until completion of the public review process.

Yours truly,

**AINLEY & ASSOCIATES LIMITED** 

Joe Mullan, P.Eng. Project Manager

# **1.0 Introduction**

This Technical Memorandum has been prepared in support of the Town of Erin Urban Centre Wastewater Servicing Class Environmental Assessment (UCWS EA) to identify and evaluate alternative solutions for the treatment of wastewater generated by the existing population and projected growth within the urban areas of Erin Village and Hillsburgh. The UCWS EA follows a 2014 Servicing and Settlement Master Plan (SSMP), completed by B.M. Ross. The SSMP completed part of Phase 1 and Phase 2 of the Class EA process and recommended construction of a new municipal wastewater collection system and wastewater treatment plant (WWTP) to service both urban communities. The SSMP also recommended discharge of the treated effluent to the West Credit River between 10th Line and Winston Churchill Boulevard.

The UCWS EA commenced in 2016 and Phases 1 and 2 were completed during the fall of 2017 with the following results:

## 1.1 Assimilative Capacity Study (ACS)

In 2014, B.M Ross performed an assimilative capacity study (ACS) as part of the SSMP. During 2016, the ACS was updated by Hutchinson Environmental Sciences Ltd. (HESL) to include hydrodynamic modelling and additional data collected since the 2014 ACS was completed. The 2014 ACS determined that phosphorous loading to the West Credit River was the limiting factor to the amount of treated wastewater that could be discharged to the West Credit River. The updated, 2016 ACS confirmed this and also established WWTP effluent limits for the discharge to the West Credit River. The effluent limits and discharge flow rates recommended in the 2016 ACS have been accepted by the Ministry of the Environment and Climate Change (MOECC) and Credit Valley Conservation (CVC).

### 1.2 Service Area

The SSMP examined the existing septic systems throughout the urban areas of Erin Village and Hillsburgh. As part of the UCWS EA, during 2016, a more detailed assessment of these systems was undertaken and a service area covering the existing developed portions of the communities was defined.

### **1.3 Plant Capacity/Service Population**

Based on the results of the ACS, the septic system survey, and discussions with Wellington County on potential new growth areas, it was established that a WWTP with an average capacity of 7,172 m<sup>3</sup>/d at an effluent phosphorus concentration of 0.046 mg/L could service all of the existing urban areas, including an allowance for infill and intensification, as well as all of the areas zoned for development within the study area, as defined by Wellington County. This flow will allow a residential population of approximately 14,559 people. When industrial, commercial, and industrial growth is included, the equivalent population is 18,873.

# 2.0 Objectives

This technical memorandum (TM) presents the evaluation of treatment technology alternatives available for Erin's proposed wastewater treatment plant. The information presented in this TM constitutes a component of Phase 3 of the Class EA process, which involves examination of alternative methods of implementing the preferred solution(s) as determined in the previous phases of the Class EA. The new WWTP will be designed to service the existing community plus projected residential, commercial, and

industrial growth in the study area. Additional technical memoranda will address other components of Phase 3 activities, including locations of the wastewater treatment plant and wastewater discharge to the West Credit River as well as collection system alternatives.

# 3.0 Design Basis

The basis of design for Erin's WWTP was developed using information from the following documents:

- The Assimilative Capacity Studies (2014 and 2016)
- Ainley technical memorandum entitled "System Capacity and Sewage Flows"
- Ainley technical memorandum entitled "Septic System Overview".

The projected sewage flow from the existing communities represents 40% of the full build out flow for the WWTP. To achieve full build out, it is envisaged that the wastewater treatment plant would be constructed in phases. For the purpose of this technology alternatives evaluation, it is assumed that the wastewater treatment plant will be constructed in two phases. It has also been assumed that the plant would be designed to have three process trains, each with a capacity equal to one third of the full build out capacity. Table 1 illustrates the capacity, timing, and allocation of flows between existing development and growth. The years selected as the "Forecasted Year of Construction" were selected to establish a life-cycle in order to perform the life-cycle cost analyses. It does not imply that the project will necessarily be constructed in those years.

| Phase   | Capacity<br>(m <sup>3</sup> /d) | Allocation to<br>Existing Population | Allocation to<br>Growth Population | Forecasted Year of<br>Construction |
|---------|---------------------------------|--------------------------------------|------------------------------------|------------------------------------|
| Phase 1 | 4,780                           | 60%                                  | 40%                                | 2020 – 2022                        |
| Phase 2 | 2,390                           | 0%                                   | 100%                               | 2028 – 2030                        |

### Table 1 – Wastewater Treatment Plant Construction Phasing

Phase 1 would provide two thirds of the full build out flow and allowable discharge to the river. Phase 1 would also provide for 100% of the required capacity to service the existing community (2,844 m<sup>3</sup>/d) as well as 45% of the total growth identified for full build out. Phase 1 allocation would be 60% to existing community and 40% to growth. Phase 2 (Full Buildout) would involve construction of one additional process train onto the Phase 1 plant to treat the maximum allowable flow that was established by the 2016 ACS. This would service all remaining growth.

For the purposes of this evaluation, it is assumed that Phase 1 will be designed to meet the effluent limits prescribed for the Full Buildout.

### 3.1 **Population and Flows**

Contributing wastewater flows were calculated as outlined in the "System Capacity and Sewage Flows" technical memorandum. Plant capacity is based on per capita residential flows for the existing urban areas with allowance for institutional, commercial, and industrial flows as well as allowances for infill and intensification in existing areas. Growth areas were established by Wellington County and flow was calculated for these areas as outlined in the "System Capacity and Sewage Flows" technical memorandum. Based on the above, a capacity of 7,172 m<sup>3</sup>/d was established to service all of the existing and growth areas. To be able to discharge this volume of treated effluent to the West Credit River, the ACS established that the effluent concentration for total phosphorus would need to be 0.046 mg/L.

Based on the maximum allowable WWTP discharge flow of 7,172 m<sup>3</sup>/d and the assumed per capita flow contributions, the number of residents that could be served is 14,559. Table 2 shows WWTP flow rates, population served, and percentage of the Full Buildout flow that each phase.

### Table 2 – WWTP Phases of Construction and Population Served

|  | Phase 1    | Phase 2 / Full Buildout |
|--|------------|-------------------------|
| Total WWTP Capacity (Average Day Flow) | 4,780 m³/d | 7, 172 m³/d             |
| Residential Population Served          | 8,864      | 14,559                  |
| Equivalent Population* Served          | 12,893     | 18,873                  |

\*Equivalent population captures contributions from commercial, institutional, and industrial sources.

### 3.2 Peaking Factor and Peak Flows

The Harmon Formula, as detailed in the Ministry of the Environment and Climate Change's "Design Guidelines for Sewage Works (2008)", was used to determine peaking factors and peak hourly flows for Phase 1 and Phase 2.

Table 3 below presents the peaking factors and peak hourly flows used for Phase 1 and Phase 2. It should be noted that the peak flows below include contributions from inflow and infiltration.

### Table 3 – Peaking Factors and Design Flows

|                       | Phase 1     | Phase 2 / Full Buildout |
|-----------------------|-------------|-------------------------|
| Average Day Flow      | 4,780 m³/d  | 7, 172 m³/d             |
| Harmon Peaking Factor | 2.84        | 2.67                    |
| Peak Hourly Flow      | 11,779 m³/d | 19,148 m³/d             |

Sewage Pumping Stations as well as specific unit processes will need to be designed for the peak instantaneous flows.

### 3.3 WWTP Influent Characteristics

The existing urban areas within the study area use private, on-site wastewater systems to manage wastewater. As such, there is no data available for the raw sewage/wastewater to be received at the new WWTP. Raw sewage characteristics used for the technology alternatives evaluation were derived from the Ministry of the Environment and Climate Change "Design Guidelines for Sewage Works (2008)", Page 8-9 and are listed in Table 4.

There are a number of rural residents who will be outside the recommended service area of the proposed wastewater collection system and will remain on septic systems. Hauled septage from these residents will be received and treated at the new WWTP.

Evaluation of the alternatives for management and treatment of septage is presented in Section 8 of this technical memorandum. The influent characteristics listed in Table 4 do not include contributions from septage. Influent characteristics that incorporate septage addition to the wastewater treatment system are presented in Section 8.3.

### Table 4 – WWTP Influent Characteristics and Loading Rates

|                                | Typical Raw Sewage       | Loading (kg/d) |                            |
|--------------------------------|--------------------------|----------------|----------------------------|
| Influent Parameter             | Concentrations<br>(mg/L) | Phase 1        | Phase 2<br>(Full Buildout) |
| Biological Oxygen Demand (BOD) | 175                      | 837            | 1,255                      |
| Total Suspended Solids (TSS)   | 175                      | 837            | 1,255                      |
| Total Ammonia Nitrogen (TAN)   | 35                       | 110            | 165                        |
| Total Kjeldhal Nitrogen        | 35                       | 167            | 251                        |
| Total Phosphorous (TP)         | 7                        | 33             | 50                         |

Loadings are calculated based on average day flows for both Phase 1 and Phase 2.

### 3.4 WWTP Effluent Limits and Objectives

In addition to phosphorous limits, the ACS established effluent limits for other regulated parameters under Full Buildout flow. For the purposes of this technical memorandum, is has been assumed that the same treatment technology will be used for Phase 1 and Full Buildout. For this reason, the effluent limits associated with the Full Buildout flow were also used as the limits for Phase 1 flow and evaluation of treatment alternatives.

The ACS also found that dissolved oxygen (DO) levels in the West Credit River are well above the Provincial Water Quality Objective (PWQO) of 6 mg/L. HESL determined that an effluent DO concentration of 4 mg/L would maintain the oxygen levels in the river.

Table 5 presents the WWTP effluent limits for the regulated parameters for Erin's WWTP.

| Parameter                                     | Effluent Concentration Limit (mg/L)  |  |
|---|--|--|
| Carbonaceous Biological Oxygen Demand (cBOD5) | 5 mg/L   |  |
| Total Suspended Solids (TSS)                  | 5 mg/L   |  |
| Total Phosphorous (TP)                        | 0.045 mg/L   |  |
| Total Ammonia Nitrate (TAN)                   | 0.6 mg/L (summer: May 15 to October 15)<br>2 mg/L (winter: October 16 to May 14) |  |
| Nitrate Nitrogen                              | 5 mg/L   |  |
| Minimum Dissolved Oxygen                      | 4 mg/L   |  |
| E. Coli.                                      | 100 cfu/100mL  |  |
| рН  | 6.5 - 8.5  |  |

### Table 5 – Erin WWTP Effluent Limits

These effluent limits are stringent when compared against other wastewater treatment facilities in Ontario. This is due to the West Credit River's classification as a Policy 1 receiver. To achieve the required level of treatment, the Erin WWTP will need to be an Advanced Wastewater Treatment Facility, incorporating both secondary and tertiary treatment and include an add-on technology for re-oxygenation of the treated effluent.

Typically, the Environmental Compliance Approval (ECA) for municipal wastewater treatment facilities includes effluent or operational objectives in addition to the effluent limits. Effluent objectives are set as

treatment goals for the WWTP as a guarantee that the limits will not be exceeded. The operational objectives proposed for Erin's WWTP are presented in Table 6.

Table 6 – Proposed WWTP Effluent / Operational Objectives

| Parameter                      | Effluent Concentration Objective   |  |
|--------------------------------|--|--|
| Biological Oxygen Demand (BOD) | 3 mg/L   |  |
| Total Suspended Solids (TSS)   | 3 mg/L   |  |
| Total Phosphorous (TP)         | 0.03 mg/L  |  |
| Total Ammonia                  | 0.3 mg/L (summer: May 15 to October 15)<br>1 mg/L (winter: October 16 to May 14) |  |
| Nitrate Nitrogen               | 4 mg/L   |  |
| Minimum Dissolved Oxygen       | 5 mg/L   |  |
| E. Coli.                       | 100 cfu / 100mL  |  |

# 4.0 Evaluation Methodology

An evaluation methodology to identify a recommended treatment technology alternative for Erin's WWTP has been developed based on methodologies and guidelines outlined in the Municipal Class Environmental Assessment. This evaluation was performed on four distinct wastewater treatment processes, which are outlined below:

- Liquid Treatment
- Aeration of the Treated Effluent
- Sludge/Biosolids Treatment
- Septage Treatment/Management

Liquid Treatment refers to the process (treatment train) that treats the raw sewage to produce the liquid effluent that can be released to the West Credit River.

Aeration of the Treated Effluent refers to the process to be used to maintain dissolved oxygen levels in the treated effluent above 4 mg/L. This is included as a separate component, since, depending on what technologies are recommended for the liquid treatment train, a separate aeration step may not be required. For example, if the preferred liquid train treatment is a membrane bioreactor (MBR), the MBR's blowers could be sized to continuously maintain a minimum DO level of 4 mg/L in the aerobic stage and since there are no processes downstream of the MBR that remove oxygen or are hindered by elevated DO levels in the wastewater stream, the DO level would remain at 4 mg/L until discharge to the river. No additional aeration step would be required prior to discharge into the West Credit River.

Sludge/Biosolids Treatment refers to the system that will treat the residual solids component of the wastewater. Treatment can be to a level where the final product can be used or disposed of off-site, i.e. to agricultural land, or treatment can be to the minimum level required to allow trucking the sludge/biosolids to an off-site, privately owned, facility for final treatment and use and/or disposal.

Septage Treatment/Management refers to the alternatives available for receiving and treating septage such that it will meet the quality requirements for discharge to the environment. Septage requires both liquid and sludge/biosolids treatment.

Evaluation of each of the four (4) treatment processes involved two main steps:

- Identification of a long list of potential alternative solutions and the screening of this list down to a short list of viable alternatives.
- A detailed evaluation of the short-listed alternatives to identify a recommended preferred alternative.

To achieve this goal, the following steps were undertaken:

- Develop a set of long-list screening criteria to screen the long list of alternatives to a short list. This set
  of criteria is meant to capture features that are considered essential to the success of the WWTP
  servicing Erin and to establish viability of the alternative.
- Develop a set of short-list evaluation criteria to evaluate the short-listed alternatives. This set of criteria consists of primary and secondary criteria and weightings. These criteria provide a more in-depth analysis of the technologies, sufficient to identify the recommended technology.
- Generate a long list of technologies that could be used for the process being evaluated.
- Use the long-list screening criteria to reduce the long list to a short list.
- Develop design concepts (treatment trains) using the short-listed technologies.
- Perform detailed evaluations of each design concept, including a life-cycle cost analysis, using the short-list evaluation criteria.
- Identify the recommended alternative, based on the results of the detailed evaluation.

Separate sets of screening/evaluation criteria were used for each of the four (4) processes, since the objectives for each process are different.

### 4.1 Approach to Life-Cycle Cost Analysis

A life-cycle cost analysis was carried out on each short-listed alternative as part of the detailed evaluation. The analyses incorporated factors such as equipment costs, construction costs, annual operating and maintenance costs, and the Net Present Value (NPV) over the expected life of the facility.

Equipment and operating costs for each alternative were obtained from budgetary quotes, solicited from relevant equipment suppliers. Construction costs for common systems were estimated from data in Ainley's possession from projects of a similar nature and scope. Estimates for general contracting, site works, and yard piping were based on a percentage of equipment and building/tankage construction costs.

Actual costs associated with each alternative may be significantly affected by inflation and market conditions, however, changes in the conditions that affect these cost estimates would affect all alternatives proportionately, since the same assumptions and rationale were used to evaluate all alternatives. In this regard, the results of the comparative cost evaluation should remain the same.

The parameters and assumptions used in the life-cycle cost analyses are listed below.

- All costs are presented in 2017 Canadian dollars.
- Phase 1 construction projected to begin in 2020 and finish in 2022.
- Phase 2 construction is projected to begin in 2028 and finish in 2030.
- NPV costs are based on a 50-year life cycle for the facility.
- Major equipment replacements were incorporated at 30-year intervals.

- Electrical and I&C costs were factored into equipment installation costs.
- An estimated inflation rate of 2% was used
- An estimated interest rate of 5% was used.
- Electricity costs of 0.11/kWh was used.
- Land costs were included in the WWTP Site Evaluation Technical Memorandum
- The estimates related to site works, assume that there is no contaminated soil on the property.
- Cost estimates are net of taxes which apply to all alternatives.

# 5.0 Liquid Treatment

### 5.1 Overview of Liquid Treatment Train Processes

Treatment of the liquid component of wastewater involves several stages, typically starting with removal of grit and larger particles and ending with disinfection of the treated effluent just prior to release to the environment. The stages traditionally associated with treating the liquid train are described below.

### Preliminary Treatment

Raw sewage arriving at the treatment plant by gravity or from a pumping station is first subjected to preliminary treatment which involves removal of larger objects and grit from the wastewater. Technologies used for preliminary treatment include various types of screens and grit removal systems. This process results in screenings and grit waste which is typically sent to a landfill.

### **Primary Treatment**

Primary treatment is geared towards removal of particles that can be easily removed without the addition of chemicals or biological means. Typically, gravity settling technologies, such as clarification, are used for primary treatment. However, other technologies, such as filters, can be used. Some secondary treatment technologies do not require primary treatment. Primary treatment produces primary sludge, which is sent to the sludge treatment system.

### Secondary Treatment

Once solids, grit, and settlables are removed from the wastewater, secondary treatment is implemented to reduce organics and other contaminants such as phosphorous, nitrogen, and ammonia. Technologies used for secondary treatment are usually biological in nature, such as aeration tanks, biological filters, and moving bed bioreactors. The biological sludge resulting from biological treatment is commonly referred to as "activated sludge" and is separated from the liquid via secondary clarification. Depending on the treatment technology used for in the secondary treatment stage, secondary sludge can either be recycled to the biological treatment step as return activated sludge (RAS) and/or sent to the sludge treatment system as waste activated sludge (WAS).

### **Tertiary Treatment**

Where secondary treatment alone cannot meet a facility's required effluent limits/objectives for particular parameters, it may be necessary to add a further treatment stage referred to as tertiary treatment. Tertiary treatment typically focuses on removal of parameters with low effluent limits, including phosphorous, nitrogen, and suspended solids.

#### Disinfection

Disinfection is performed to deactivate and/or kill pathogenic micro-organisms found in the liquid stream. Typically, E. coli is used as the indicator organism to measure the effectiveness of the disinfection process. Traditionally, chlorination has been used for disinfection, however, ultra-violet radiation and ozonation are becoming more common.

The effluent limit on nitrogen species for the Town of Erin is lower than most wastewater treatment facilities in Ontario. Typically, the MOE enforces a limit on total ammonia nitrogen (TAN). However, the West Credit River ACS, through the suggestion by the CVC, also recommends a limit on nitrate-nitrogen in to ensure that the nitrate-nitrogen loading to the river will be at a level that will not negatively impact the brook trout fishery in the river. Achieving the nitrate-nitrogen effluent limit requires a treatment process that can remove both ammonia and nitrate nitrogen.

In domestic wastewater, nitrogen generally exists as ammonia (NH<sub>4</sub>). In order to remove nitrogen from the wastewater, a two-step process called nitrification/denitrification must take place. Nitrification is the conversion of ammonia to nitrite (NO<sub>2</sub>) and then to nitrate (NO<sub>3</sub>). Denitrification is the conversion of nitrate to nitrogen gas, which is released to the atmosphere.

The nitrification process requires the presence of oxygen (aerobic conditions) to convert ammonia to nitrite  $(NO_2)$  and nitrate  $(NO_3)$ . The denitrification process, on the other hand, can only take place where the oxygen concentration is less than 0.5 mg/L (anoxic conditions). In the absence of free oxygen, denitrifying bacteria will use the oxygen in the nitrate molecules as they assimilate BOD. This process releases nitrogen in gaseous form.

The treatment alternative chosen for Erin will need to incorporate steps that will nitrify and denitrify the wastewater in order to achieve the treatment objectives for TAN and nitrate-nitrogen.

For the purposes of this evaluation process, preliminary treatment was not evaluated since the alternatives available will not be appreciably different in terms of environmental impact or cost.

### 5.2 Liquid Train Evaluation Criteria

### 5.2.1 Long-List Screening Criteria

The criteria selected for long-list screening of the liquid train alternatives are presented in Table 7.

### Table 7 – Liquid Train Long-List Screening Criteria

| Criteria                                | Description  |  |  |
|---|--|--|--|
| Proven Reliability                      | Demonstrated track record of consistently meeting and/or exceeding the treatment objectives set forth for the UCWS EA. |  |  |
| Ease of Expansion to Buildout           | Ability of the system to easily to expand to meet UCWS EA WWTP Full Buildout capacity.                                 |  |  |
| Operation and<br>Maintenance Complexity | Simplicity of operation and maintenance and level of staffing required.  |  |  |

| Criteria | Description   |
|----------|---|
| Cost     | Have value in terms of performance and/or operation and maintenance that are reflective of the capital costs. |

#### **Proven Reliability**

In order to gain acceptance and approval by the Ministry of Environment and Climate Change (MOECC) in Ontario through the issuance of an Environmental Compliance Certificate (ECA), proponents must be able to demonstrate that a treatment process can achieve the required objectives on a consistent basis. In order for a technology to be carried forward for detailed analysis, the technology must therefore have a demonstrated history of being reliable and able to meet the performance requirements set out for the UCWS EA.

For primary and secondary treatment, MOECC typically prefers a minimum of three successfully operating plants of similar size and capacity, located in a similar climate and with comparable effluent criteria in order to be considered for implementation in Erin.

The effluent limit set for phosphorous will require best available technology to achieve the desired contaminant removal. There are several advanced treatment processes that have been proven successful at the proposed limits for phosphorus, however, operating plants under similar conditions as those proposed for Erin is limited. Tertiary treatment technologies that have been successfully proven in both operating plants and pilot studies to achieve the required phosphorous removal levels were considered in the long list.

Other factors taken into consideration include the technology's ability to adjust to changing influent conditions, such as high/low flows or fluctuations in sewage characteristics.

#### Ease of Expansion to Buildout

This criterion reviews how easily a technology can be expanded to match the facility's planned expansion from initial construction to Phase 2 / Full Buildout. Alternatives that require minimal component upgrades and financial investment were rated more favourably.

#### Operation / Maintenance Complexity

This criterion reviews how complex the technology/system is to operate and maintain. It also reviews the required operator skill level and staffing requirements. Technologies that were deemed very complex to operate or to have intensive maintenance schedules were excluded from the short list of alternatives, as are technologies that require highly skilled operators.

#### Cost

The cost criterion looks at capital cost, operation and maintenance costs, and the net present value of the alternative. Capital costs include purchase of equipment and its installation as well as the construction costs of tanks and buildings. Operation and maintenance aspects include costs related to utilities (electricity, gas, potable water), chemicals, etc. It should be noted that labour costs associated with the number of operators required were considered equivalent for all alternatives.

### 5.2.2 Short-List Evaluation Criteria

The criteria and weightings selected for the liquid train short-list evaluation are presented in Table 8 and descriptions of each follow.

Where warranted, weightings for some criteria were adjusted, to more accurately reflect the differing objectives in the process being evaluated. Where weightings were revised from those shown below, the revised weightings are listed in the report before the results of the analysis are presented.

| Primary Criteria | Weight | Secondary Criteria   | Weight |
|------------------|--------|--|--------|
| Social / Culture | 15%    | Aesthetic Impacts (plant appearance)   | 10%    |
|                  |        | Traffic Impacts (during construction and operation)                              | 10%    |
|                  |        | Noise Impacts (during operation)   | 40%    |
|                  |        | Odours Impacts (during operation)  | 40%    |
| Technical        | 35%    | Ability to Meet Regulatory Objectives  | 30%    |
|                  |        | Technology / Process Robustness  | 30%    |
|                  |        | Ease of Expansion and Phasing to Buildout  | 20%    |
|                  |        | Energy Requirements  | 5%     |
|                  |        | Operation & Maintenance Requirements (simplicity, operator skill level/quantity) | 10%    |
|                  |        | Site Requirements (plant footprint)  | 5%     |
| Environmental    | 20%    | Public Health and Safety   | 30%    |
|                  |        | Sustainability   | 20%    |
|                  |        | Climate Change Impacts / Greenhouse Gas<br>Generation                            | 20%    |
|                  |        | Natural Environment Impacts  | 10%    |
|                  |        | Waste Generation   | 20%    |
| Economic         | 30%    | Capital Cost   | 30%    |
|                  |        | Operation and Maintenance Costs  | 40%    |
|                  |        | Net Present Value  | 30%    |

### Table 8 – Liquid Train Short-List Screening Criteria

### Social/Culture

**Aesthetic Impacts:** Aesthetic impacts relate to the technology's or facility's physical appearance and how aesthetically pleasing it might be. Alternatives that are more likely to blend in with the rural agricultural setting scored higher in the evaluation.

**Traffic Disruption/Truck Traffic:** This criterion captures the level of traffic disruption that could exist during the facility's construction and day-to-day operation. Factors considered would be delivery of large amounts of concrete during construction, which would result in numerous concrete trucks travelling to the site. Pre-fabricated units have a lesser impact on the local traffic during construction. Traffic impacts during operation would include increased traffic due to such activities as frequent chemical deliveries. A higher score was given to technologies/systems that would minimize traffic disruptions.

**Noise Impacts:** This criterion relates to the amount of noise that would be generated during normal operation of the facility. Systems with numerous pieces of motorized equipment or that require continuous blower operation rather than intermittent blower operation would have higher noise emissions. Technologies with lower noise generation were scored higher.

**Odours:** The odours criterion relates to the likelihood for a technology to emit/generate odours during normal operation. For example, odours from systems housed in an enclosed space/building may be more easily controlled than odours from open tanks. Technologies that minimize odours were scored higher than those prone to emitting odours.

#### Technical

**Ability to Meet Regulatory Objectives**: The ability to meet regulatory objectives relates to a technology's ability to consistently achieve the effluent limits and objectives. The required phosphorous effluent limit for Erin is very low. Technologies with a demonstrated ability to consistently meet Erin's phosphorous effluent limits, in addition to the other regulated parameters, were scored higher.

**Process Robustness:** The robustness of a technology refers to its ability to cope with or adjust to changing operational demands and adverse events. Examples include the system's ability to cope with unexpected high flow events, variations in sewage strength, temperature variations, weather events, or utility interruptions. A higher score was applied to technologies/systems that are more flexible to operational fluctuations.

**Ease of Expansion and Phasing to Buildout:** The technology chosen for Erin must be able to expand relatively easily to grow with Erin's population. The technology will also need to be able to facilitate expansion under a phased development plan to meet the full buildout population. Processes or technologies which require minimal component upgrades as the system expands were rated more favourably.

**Energy Requirements:** The energy requirements for some technologies can be higher than others and would have a higher environmental and cost impact. Alternatives with lower energy requirements were scored higher in the evaluation.

**Operation and Maintenance Requirements:** This criterion captures the level of effort required by operations staff to operate and maintain the system as well as staffing requirements and operator skill level. Systems that require minimal operational intervention, standard operator skill level, and fewer staff were rated more favorably.

**Site Requirements:** Site requirements relate to the space that will be needed for the technology / system as compared to the space available for the treatment facility.

#### Environmental

**Public Health and Safety:** This criterion looks at the level of risks posed to the public, such as accidents, spills, fires, etc. Examples of these risks include high temperature/pressure operations or increased handling of hazardous chemicals.

**Sustainability:** This criterion captures a technology's ability to meet current needs for performance and protection of the environment in a way that will not negatively impact the environment in the future. It also includes the ability of the alternative to maintain its performance over the life of the facility.

**Climate Change Impacts/Greenhouse Gas Generation:** The criterion relates to how the technology might contribute to climate change. Factors such as greenhouse gas emissions are considered. Processes with lower impacts on climate change triggers were scored higher in the evaluation.

**Impacts to the Natural Environment:** This criterion captures impacts on the local flora and fauna during construction and operation. If construction associated with an alternative would require removal of a large number of trees or significant disturbances to local wildlife, it scored lower in the evaluation.

**Waste Generation:** This criterion reflects the amount of waste that an alternative would produce. Waste can be in the form of waste chemicals, filter media, replacement parts, etc.

#### Economic

**Capital Cost:** This criterion relates to the financial investment required to purchase and install the alternative. Factors such as equipment cost, installation costs, construction of ancillary infrastructure, and land costs were evaluated. Alternatives with lower capital costs were rated more favourably.

**Operation and Maintenance Costs:** This criterion captures the estimated cost to operate and maintain the system. Aspects considered include cost of utilities (electricity, gas, water), cost of chemicals, such as coagulants, and frequency of major equipment replacements.

**Net Present Value:** The Net Present Value analysis captures the present value of all costs associated with initial construction and operation and maintenance of the technology / system for the expected life span of the technology / system. The net present value analysis in this report uses a 50-year life cycle.

## 5.3 Screening of Long List of Liquid Train Treatment Technologies

The long list of technologies considered for the primary, secondary, tertiary, and disinfection treatment process of the liquid treatment train are listed, described, and evaluated in Table 9.

#### Table 9 – Evaluation of Long List of Liquid Train Treatment Technologies

|       |   |  |                 | Screening Criteria   |              |              |                  |   |
|-------|---|--|-----------------|----------------------|--------------|--------------|------------------|---|
| No.   | Technology  | Description  | Track<br>Record | Ease of<br>Expansion | O&M          | Cost         | Carry<br>Forward |   |
| Prima | ary Treatment   |  |                 |                      |              |              |                  |   |
| P1    | Conventional Primary Clarifier                                    | Conventional clarifier that employs gravity settling to remove<br>settleable particles. A sludge collection system scrapes the settled<br>solids from the bottom of the clarifier into sludge hoppers. A scum<br>collection system scrapes scum from the top of the clarifier into a<br>scum hopper.   | $\checkmark$    | ~                    | $\checkmark$ | ~            | Yes              | <ul> <li>Well esta</li> <li>Easily ex</li> <li>Well esta</li> <li>Capital co</li> </ul>               |
| P2    | Enhanced Primary Treatment  | Technologies that would have higher solids removal compared to a conventional clarifier and needed to facilitate or enhance secondary treatment technologies. For example, use of filtration for high solids removal to pair with membranes in the secondary treatment or use of a clarification technology that also includes some nutrient removal in order to reduce loading on secondary treatment.  | $\checkmark$    | ~                    | $\checkmark$ | ~            | Yes              | <ul> <li>These typ<br/>needed to<br/>considered</li> </ul>  |
| Prima | ary / Secondary Treatment   |  |                 |                      |              |              |                  |   |
| S1    | Modified Conventional Activated<br>Sludge System (CAS)            | The traditional CAS process involves primary settling via a standard clarifier, followed by aeration, and completed by secondary clarification. The CAS process is a flexible process that can be modified to denitrify by adding one or more anoxic tanks and/or perform phosphorous removal by dosing with coagulant at one or multiple locations in the process.  | $\checkmark$    | ~                    | $\checkmark$ | $\checkmark$ | Yes              | <ul> <li>The CAS</li> <li>Easily ex</li> <li>Well esta</li> <li>Costs are</li> </ul>                  |
| S2    | Extended Aeration   | The extended aeration process is similar to the CAS process, except<br>the primary clarification step is removed. Preliminary treated sewage<br>is fed directly to the aeration tank. The residence time is between a<br>minimum of 15 hours compared to 6 hours in the CAS process.<br>Aeration tank effluent flows to a secondary clarifier for solids<br>separation.  | Х               | ~                    | $\checkmark$ | ~            | No               | <ul> <li>Well- esta</li> <li>Easily ex</li> <li>O&amp;M req</li> <li>Costs are</li> </ul>             |
| S3    | Sequencing Batch Reactor (SBR)<br>for Biological Nutrient Removal | The SBR process performs BOD and nitrogen removal and settling in<br>the same tank. The phases in the SBR process are fill, react, settle,<br>decant, and idle. During the react stage, air is introduced into the<br>reactor to facilitate biological growth. Primary treatment and<br>secondary clarification are not required in an SBR system. SBRs can<br>accommodate fluctuations in flows by either adjusting cycle times or<br>via an equalization tank upstream of the SBR or a combination of<br>both. SBRs can also achieve the advanced nutrient removal required<br>for Erin. | $\checkmark$    | ~                    | V            | ~            | Yes              | <ul> <li>SBR is a</li> <li>Easily ex<br/>the proce</li> <li>O&amp;M req</li> <li>Costs are</li> </ul> |
| S4    | Rotating Biological Contactors<br>(RBC)                           | An RBC consists of a cylinder of plastic discs that are mounted on a rotating shaft. The cylinder is partially submerged in the wastewater and continuously rotated. Micro-organisms attach to and grow on the discs. Exposure to air when portions of the discs are out of the wastewater provides oxygen to the organisms and submergence  | x               | ~                    | x            | ~            | No               | <ul> <li>Lack of o</li> <li>Easily ex</li> <li>O&amp;M diffiwashed of</li> </ul>                      |

|        |   | causes the organisms to take up the nutrients in the wastewater.<br>Nitrification and denitrification both occur on the RBC.   |                 |                      |              |              |                  | <ul> <li>Costs are</li> </ul>  |
| S5     | Membrane Bioreactors (MBR)  | An MBR is a modified CAS process with membranes submerged in<br>the aeration tank or installed downstream of the aeration tank. The<br>membranes combine microfiltration or ultrafiltration with a suspended<br>growth process. The combination provides high nutrient and<br>suspended solids removal. Secondary clarifiers and filtration are not<br>required with an MBR system. Sewage temperature will affect an<br>MBR's treatment capacity. MBRs also remove particulate<br>phosphorous, so a tertiary stage may not be needed. Treatment<br>capacity is affected at lower wastewater temperatures. | V               | ✓                    | V            | √            | Yes              | <ul> <li>MBR is a record for</li> <li>Relatively secondary</li> <li>O&amp;M requor of clarifier</li> <li>Membrane intervals, e</li> <li>Costs are</li> </ul>       |
| S6     | Moving Bed Bioreators<br>(MBBR)   | An MBBR uses plastic media, suspended in an aerated tank. Micro-<br>organisms attach to and grow on the media. Nitrification takes place<br>in an aerated tank and denitrification is achieved in a second, anoxic<br>tank.  | х               | ~                    | $\checkmark$ | V            | No               | <ul> <li>MBBR is a achieving</li> <li>Easily exp</li> <li>O&amp;M requ</li> <li>Costs are</li> </ul>   |
| S7     | Integrated Fixed Film Activated<br>Sludge (IFAS) Process with<br>Chemical Addition for<br>Phosphorous Removal | The IFAS process is a variation of an MBBR. IFAS combines the CAS system (suspended growth) with a biofilm on media system (attached growth). Plastic media is added to the aeration stage to provide surface area for micro-organisms to attach to and grow. The IFAS system achieves BOD removal and nitrification via the mix liquor suspended growth (MLSS) and denitrification via the biofilm on the media. Effluent from the IFAS goes to a clarifier to separate solids.   | Х               | ✓                    | Х            | ~            | No               | <ul> <li>Only one s<br/>in achievir</li> <li>Easily exp</li> <li>Operation<br/>without aff</li> <li>Costs are</li> </ul>   |
| S8     | Two-Staged Biological Aerated<br>Filters (BAF)  | BAFs are usually up-flow filters that use granular or plastic media.<br>BOD removal and nitrification would take place in an aerated BAF<br>and denitrification would occur in a subsequent anoxic BAF. An<br>external carbon source would be needed in the anoxic tank to feed<br>the biomass. A clarifier is not needed downstream of a BAF.   | х               | ~                    | х            | $\checkmark$ | No               | <ul> <li>Lack of his</li> <li>Ease of ex</li> <li>O&amp;M require</li> <li>Costs are</li> </ul>  |

#### Rationale

#### comparable with other technologies

- relatively newer technology, but now has a proven track advanced nutrient removal
- v easy to expand by adding membrane cartridges and no y clarifier or tertiary system to expand
- uirements higher than CAS system but offset by removal r and tertiary treatment in system
- es require regular replacement at five to twelve year
- depending on the effectiveness of preliminary treatment.
- e comparable with other technologies
- a newer technology, but insufficient experience in advanced nutrient removal
- banded by adding media to void space
- uirements comparable with other technologies
- comparable with other technologies
- successful installation in Ontario. Insufficient experience ng advanced nutrient removal
- banded by adding more media to void space
- nal difficulties associated with retaining media in tank
- ffecting hydraulics and foaming issues reported
- comparable with other technologies
- istory in advanced nutrient removal
- expansion is comparable with other technologies
- uirements are high
- e comparable with other technologies

chnology. Well applied for drinking water installations in

- xpanded by adding membrane cartridges
- v complex O&M requirements, but acceptable due to its prmance
- nes require regular replacement at ten-year intervals.
- e relative to other technologies, but acceptable due to its ormance and ability to meet effluent criteria with minimal addition.

#### 5.3.1 Summary of Short-List Technologies

The technologies that were short-listed for detailed evaluation for the liquid train treatment are listed below.

#### **Primary Treatment**

- Conventional Primary Clarifier
- Advanced Primary Treatment

#### Secondary Treatment

- Modified Conventional Activated Sludge Process
- Sequencing Batch Reactor
- Membrane Bioreactor

#### **Tertiary Treatment**

- Tertiary Membrane Filtration (Ultrafiltration)
- Two-Stage Up-Flow Sand Filters
- Adsorptive Deep Bed Filtration

#### **Disinfection Treatment**

- Chlorination/De-Chlorination
- Ultraviolet Radiation

# 5.4 Detailed Description of Liquid Train Short Listed Technologies

#### 5.4.1 Technology Alternatives for Primary Treatment

The short listed primary treatment technologies are not all applicable to all of the short listed secondary treatment technologies. As such, the detailed evaluation of the primary treatment technologies has been coupled together with the detailed evaluation of the secondary treatment alternatives in order to identify the best combination of primary-secondary treatment.

#### 5.4.2 Technology Alternatives for Primary/Secondary Treatment

#### Alternative 1: Modified Conventional Activated Sludge Process (CAS)

Figure 1 shows a flow schematic of the modified CAS process. The primary treatment alternative that couples with the CAS process is a traditional primary clarifier. For advanced nutrient removal, the CAS system is modified to include an anoxic zone upstream of the aeration tank. The anoxic zone is used to facilitate denitrification.

Wastewater flows from the preliminary treatment system into the primary clarifier, where settleable solids are removed. Sludge and scum from the primary clarifier are directed to the sludge/solids treatment system.

From the primary clarifier, wastewater flows into the anoxic zone, where denitrification takes place. The denitrification step is positioned upstream of the nitrification step (aeration) because denitrifying bacteria require sufficient BOD (carbon source) in the wastewater to support their metabolic activity and the aeration

step reduces BOD levels. Denitrifying bacteria are introduced into the anoxic zone via a recycled activated sludge (RAS) stream from the secondary clarifier and nitrates are introduced into the anoxic zone through a nitrified mixed liquor recycle stream from the aeration tank.

Figure 1 – Modified CAS Process Flow Schematic

In the anoxic zone, the denitrifying bacteria use the component of the nitrate molecule as an oxygen source for respiration and release nitrogen gas as a product.

The wastewater serves as a carbon source to the denitrifying bacteria. However, if BOD levels in the wastewater are not high enough, an external carbon source, such as methanol, would be required.

From the anoxic zone, wastewater flows to the aeration tank where BOD levels are reduced and ammonia and ammonium are converted to nitrate. Alternatives for aeration as applicable to all secondary treatment processes involve installation of high efficiency fine bubble diffusers systems and high efficiency blowers. If chemical phosphorous removal is included in this system, the coagulant can be added in the aeration tank and/or the anoxic tank.

The final step in the modified CAS process is removal of solids, which is typically done by a secondary/final clarifier. Sludge that is not recycled as RAS to the anoxic zone, is classified as waste activated sludge(WAS) and can be pumped directly to the sludge/biosolids treatment system or sent to the primary clarifier sludge hoppers for co-thickening before being sent to the sludge/biosolids treatment system.

Figure 2 shows a schematic of the biological stage of the modified CAS process. The anoxic zone and aeration tank could be constructed as a pair of independent channels for Phase 1, where one channel could serve as a by-pass to the other in the event that maintenance is required in one of the channels and it needs to be taken out of service.

A third channel would be constructed to accommodate Phase 2 flows. The plant layout shows the use of rectangular clarifiers, which were chosen based on the east of construction and expansion compared with circular clarifiers. However, circular clarifiers have equivalent benefits and are also viable. Selection of rectangular or circular clarifiers can be made during the design phase. Sufficient space has been identified for the WWTP site to support either alternative.

Figure 2 – Modified CAS Reactor Layout

Advantages and disadvantages of the modified CAS process are listed in 9 Table 10.

#### Table 10 – Advantages and Disadvantages of Modified CAS Process

| Advantages   | Disadvantages   |  |  |  |
|--|---|--|--|--|
| <ul> <li>Well understood process and easy to operate</li> <li>Construction is straightforward.</li> <li>Lower aeration demand/costs when coupled with primary treatment.</li> <li>Relatively easy to expand if clarifiers and biological system constructed as rectangular tanks.</li> </ul> | <ul> <li>System not very flexible for high flow events</li> <li>Tertiary treatment stage would be needed for the required advanced phosphorous removal.</li> <li>Requires large amount of chemical if phosphorous removal is required in the secondary treatment stage to facilitate advanced removal in the tertiary treatment stage.</li> </ul> |  |  |  |

#### Alternative 2: Sequencing Batch Reactor (SBR)

The SBR system uses a single tank/reactor as the anoxic tank, the aerobic tank, and the settling tank required for biological removal of nutrients from the wastewater. Primary clarification is not required in an SBR system. Wastewater flows from the preliminary treatment system directly to the SBR reactor. Figure 3 shows a flow schematic of a SBR system. All phases of the of treatment by the SBR occur in the reactor.

The SBR reactor is divided into two sections, a "pre-react" zone, where no aeration is provided and a main zone, which includes an aeration system. In general, there are four stages in the operation of an SBR, all of which occur in a single reactor. The typical stages are: fill, react, settle, decant, which are shown in Figure 3. There are several variations to the sequence and duration of each cycle, depending on the vendor.

#### Figure 3 – Sequencing Batch Reactor Process Flow Schematic

During the fill stage, wastewater is introduced into the reactor into the pre-react zone along with a coagulant to precipitate phosphorous and a carbon source for the denitrifying bacteria, if needed.

The react phase occurs next where wastewater flows to the main zone and air is introduced into the reactor to support the micro- organisms that convert ammonia to nitrite and nitrate. Once the react phase is complete, the settle phase takes place, where the aeration system is de-activated and denitrification takes place. The settle phase also is a quiescent period that allows solids to settle to the bottom of the reactor. The final step is the decant phase in which the treated wastewater is decanted out of the SBR, via a decanter at the effluent end of the reactor.

Effluent from the SBR flows to an equalization tank designed to allow secondary effluent to be pumped to the tertiary treatment stage at an even flow rate.

The SBR includes two sets of pumps in the main zone. The pumps and their functions are described below:

- RAS Pumps: Pumps activated sludge from the main zone to the pre-react zone to keep the microorganisms required to convert nitrates to nitrogen gas in the reactor.
- WAS Pumps: Pumps waste activated sludge from the main zone in the settle phase to the sludge/biosolids treatment system

In systems where the BOD levels in the SBR influent wastewater is not high enough to sustain the denitrifying micro-organisms, an external carbon, such as methanol, would be needed as supplemental carbon source.

To achieve the high level of phosphorous removal required for Erin, a coagulant is added in to the reactor to precipitate phosphorous and reduce loading to the tertiary treatment system.

Figure 4 shows the general layout of an SBR unit. As with Alternative 1 above, the SBR system would be constructed as three treatment trains. Phase 1 flow would be treated using two SBRs and a third would be added to treat Phase 2 flows.

Figure 4 – Sequencing Batch Reactor Layout

Table 11 presents the advantages and disadvantages of the SBR treatment process.

#### Table 11 – Advantages and Disadvantages of the SBR Process

| Advantages   | Disadvantages  |
|--|--|
| <ul> <li>Simple construction as reactors systems can<br/>come as prefabricated modules.</li> </ul>   | <ul> <li>Operation is slightly more complex than CAS<br/>system.</li> </ul>  |
| <ul> <li>Very resilient to extreme flow conditions by<br/>adjusting cycle times and/or adding an<br/>equalization tank upstream of the SBR.</li> </ul> | <ul> <li>Tertiary treatment stage would be needed for the required advanced phosphorous removal.</li> <li>Equalization tank is required prior to downstream</li> </ul> |
| <ul> <li>Relatively easy to expand.</li> </ul>   | treatment processes.   |
| <ul> <li>Small footprint as primary and final clarifiers<br/>not required.</li> </ul>  | <ul> <li>More frequent sludge wasting compared with<br/>CAS process.</li> </ul>  |

#### Alternative 3: Membrane Biological Reactor (MBR)

A membrane bioreactor system combines the activated sludge process with a filtration process. Figure 5 presents a general flow schematic of an MBR system. Membranes used in an MBR system will be low-

pressure microfiltration or ultrafiltration membranes. Through the filtration process and use of coagulants an MBR system can achieve the effluent limits, including phosphorous, without requiring a tertiary treatment step.

Figure 5 – Membrane Bioreactor Process Flow Schematic

For the MBR membranes to operate without excessive fouling and shutdowns for cleaning, an advanced primary clarification technology is needed for advanced solids and particle removal as compared with a traditional primary clarifier. A rotary belt filter (such as a Salsness filter) has been coupled with the MBR alternative because of its ability to remove fine particles, including hair, which is a common cause of excessive membrane fouling.

Wastewater from the preliminary treatment stage would flow to the belt filter which incorporates a rotating, polyethylene filter mesh/belt, which is partially submerged in the wastewater at approximately a 45-degree angle. As wastewater flows across the filter mesh particulates are collected on the mesh and carried upwards out of the liquid. A jet of compressed air is used to blow the screenings off the mesh and into a collection bin. The screenings can be disposed of at a landfill.

From the advanced primary treatment step, wastewater flows into the bioreactor, which consists of an anoxic zone and an aerobic zone. The anoxic zone is designed for denitrification and the aerobic zone is designed for nitrification and BOD reduction. A coagulant is added at the bioreactor step to facilitate phosphorous precipitation and removal by the membranes.

The MBR membranes can either be submerged in the aerobic zone of the biological reactor tank or housed in separate tanks downstream of the aerobic zone. This evaluation used membranes submerged in separate tanks. However, various vendor variations are available. Effluent from the biological reactor flows to the membrane tanks where pollutants are filtered out of the wastewater. Filtrate from the membranes is pumped to the disinfection system.

Filtration occurs in an aerobic environment and a continuous supply of air is required in the membrane tanks.

Figure 6 shows a general layout of the membrane biological reactor process.

Table 12 presents the advantages and disadvantages of the MBR treatment process.

#### Table 12 – Advantages and Disadvantages of the MBR Process

| Advantages  | Disadvantages   |
|---|---|
| <ul> <li>The pore size of Ultrafiltration Membranes<br/>(MF) acts as an absolute barrier to<br/>suspended solids containing particulate<br/>phosphorus, bacteria and viruses, and large<br/>molecules.</li> </ul> | <ul> <li>Complex operation requiring advanced control systems.</li> <li>Aeration costs are higher than other technologies, due to aeration requirement in the bioreactor tank and the membrane tank.</li> </ul> |
| <ul> <li>Tertiary treatment stage would not be needed<br/>to achieve the required advanced<br/>phosphorous removal.</li> </ul>  | <ul> <li>Membrane modules require replacement every 5<br/>to 12 years, which is an added cost.</li> </ul>   |
| <ul> <li>Smaller footprint than other technologies.</li> </ul>  |   |

Figure 6 – Membrane Bioreactor Layout

#### 5.4.3 Cost Comparison of Short Listed Primary/Secondary Treatment Alternatives

Table 13 summarizes the results of the life-cycle cost analyses for the three, short-listed primary/secondary treatment alternatives. Estimates have been rounded to the nearest thousand dollars. Details of the life-cycle cost analysis can be found in Appendix A.

An important factor in the cost of the membrane bioreactor system is the membrane replacement interval. The life cycle analysis includes replacement of the membrane modules at a ten-year frequency. There are examples of membranes having a lifespan greater than ten years, however, the more conservative approach was used in this evaluation.

|  | Modified<br>Conventional<br>Activated Sludge | Sequencing Batch<br>Reactor | Membrane<br>BioReactor |
|--|--|-----------------------------|------------------------|
| Capital Cost                             | \$10,436,000                                 | \$11,749,000                | \$21,168,000           |
| Annual Operation and<br>Maintenance Cost | \$3,251,000                                  | \$4,242,000                 | \$6,850,000            |
| Net Present Value                        | \$13,687,000                                 | \$15,991,000                | \$28,018,000           |

#### Table 13 – Cost Estimates for Primary/Secondary Treatment Alternatives

#### 5.4.4 Technology Alternatives for Tertiary Treatment

#### Alternative 1: Adsorptive Deep Bed Filtration

An adsorptive deep bed filter is configured and operated in a similar manner as a continuous up-flow sand filter. However, an adsorptive deep bed filter system applies a hydrous ferric oxide coating to the sand media. Phosphorous and other metals in the wastewater are chemically attracted to the coating and adsorb onto the coated sand particles.

An airlift transports media with the attached contaminants upwards into a washbox where the hydrous ferric oxide coating and contaminants are washed off. The used hydrous ferric oxide and contaminants flow out of the filter and the cleaned media settles back to the filter bed and is recoated with hydrous ferric oxide for another filter cycle.

It should be noted that this technology is primarily sold by one vendor.

#### Alternative 2: Two-Stage Continuous Up-Flow Sand Filtration

A continuous up-flow sand filter is a type of moving bed filter where the filter media (sand) is continuously cleaned, which avoids the need to shut down the unit for backwashing. Wastewater from the secondary treatment system enters the filter tank at the bottom and flows upwards through the filter bed. Suspended particles are filtered out of the wastewater stream. This technology as a single pass filter is successfully used at multiple locations throughout Ontario.

To achieve the advanced phosphorous removal required for Erin, two filters, connected in series, would be needed. Filtrate from the first unit is the influent to the second filter.

A coagulant is added to the wastewater, upstream of the first filter, to flocculate reactive phosphorous and facilitate its removal by the filter media.

It should be noted that this technology is primarily sold by two vendors.

#### Alternative 3: Tertiary Membranes

Membrane filtration uses pressure or vacuum to drive the wastewater through a permeable membrane to remove pollutants. Low-pressure membranes are categorized by the membrane pore size. Tertiary membrane systems typically use either microfiltration or ultrafiltration membranes. Microfiltration membranes have a pore size small enough to prevent the passage of bacteria and ultrafiltration membranes have a pore size small enough to prevent the passage of viruses. This evaluation was based on discussion with pressurized tertiary membranes vendors, however, implementation would involve bids from all types of membrane suppliers. These membranes are used in multiple drinking water treatment plants across Ontario and would produce a very high quality effluent.

Membranes can be installed in a dedicated tank where wastewater from the secondary treatment system is passed through the filter modules or, in the case of pressurized membranes, installed in a building and wastewater from the secondary treatment stage is pumped through the filter modules.

To prevent excessive fouling of the tertiary membranes a pre-filtration step is required upstream of the tertiary membranes to remove particulates that can clog the membranes. The pre-filter can be an automatic backwash type of filter and needs to be able to remove hair, which is a common cause of membrane fouling.

#### Cost Comparison of Short Listed Tertiary Treatment Alternatives

Table 14 summarizes the results of the life cycle-cost analysis of the three, short-listed tertiary treatment alternatives. Estimates have been rounded to the nearest thousand dollars. Details of the life-cycle cost analysis can be found in Appendix B.

It should be noted that pre-filters for the tertiary membranes have been include in the life-cycle costs of the tertiary membranes as well as filter module replacement at ten-year intervals.

|  | Adsorptive Deep Bed<br>Filtration | Two-Stage Up-Flow<br>Sand Filtration | Tertiary<br>Membranes |
|--|-----------------------------------|--------------------------------------|-----------------------|
| Capital Cost                             | \$15,570,000                      | \$9,795,000                          | \$14,050,000          |
| Annual Operation and<br>Maintenance Cost | \$6,037,000                       | \$7,512,000                          | \$5,082,000           |
| Net Present Value                        | \$21,607,000                      | \$17,307,000                         | \$19,132,000          |

#### Table 14 – Cost Estimates for Tertiary Treatment Alternatives

#### 5.4.5 Technology Alternatives for Disinfection

#### Alternative 1: Chlorination/De-Chlorination

A chlorination/de-chlorination disinfection system achieves disinfection by dosing the treated wastewater with a chlorine solution. Typically, a solution of chlorine gas or sodium hypochlorite is used as the chlorinating agent. Chlorine released into the receiving water stream negatively impacts all forms of life in the stream. For this reason, a de-chlorination process is needed to remove residual chlorine prior to discharge to the river. For the purposes of this evaluation, sodium hypochlorite was assumed as the disinfecting agent and sodium bisulphite was used as the de-chlorinating agent.

Treated wastewater from the tertiary treatment system would enter a chlorine contact tank, where chlorine would be metered into to wastewater at the contact tank's inlet channel. The contact tank would be designed to provide the required amount of contact time between the chlorine and wastewater to allow the disinfection process to take place.

Residual chlorine would be removed by adding a dechlorinating agent to the contact tank effluent channel. Sodium bisulphite is often used as the dechlorinating agent.

Advantages and disadvantages of the chlorination/de-chlorination alternative are listed in Table 15.

#### Table 15 – Advantages and Disadvantages of Chlorination/De-Chlorination

| Advantages   | Disadvantages   |
|--|---|
| <ul> <li>Proven effective and historically, extensively<br/>used.</li> </ul>                       | <ul> <li>Negatively impacts all forms of life in receiving water.</li> </ul>                                      |
| <ul> <li>Well understood process.</li> </ul>   | <ul> <li>Over-dosing with the dechlorination chemical can</li> </ul>  |
| <ul> <li>Effectiveness is not affected by water<br/>characteristics, such as turbidity.</li> </ul> | reduce the dissolved oxygen concentrations in the wastewater and lower effluent DO levels.                        |
|  | <ul> <li>Operation requires skilled operators with a good<br/>understanding of chlorination chemistry.</li> </ul> |
|  | <ul> <li>Added risk to worker health and safety due to<br/>handling of liquid or gaseous chlorine.</li> </ul>     |
|  | <ul> <li>Requires a building to house chemical dosing and<br/>storage systems.</li> </ul>                         |

#### Alternative 2: UV Disinfection

Disinfection via UV radiation involves exposing micro-organisms in wastewater to UV light within the 200 to 300 nanometer wavelength range. This range is called the germicidal range because micro-organisms, such as bacteria, viruses, and protozoa, are deactivated and lose the ability to reproduce after exposure.

A UV disinfection system consists of a bank of UV radiation emitting tubes, which are submerged in the wastewater, usually a concrete channel. As the wastewater flows across the UV tubes, micro-organisms are exposed to the radiation and become deactivated.

Advantages and disadvantages of the UV disinfection alternative are listed in Table 16.

#### Table 16 – Advantages and Disadvantages of UV Disinfection

| Advantages  | Disadvantages  |
|---|--|
| <ul> <li>Proven effective on multiple installations in<br/>Ontario</li> </ul>   | <ul> <li>Effectiveness depends on water quality, i.e.<br/>transmissivity and turbidity.</li> </ul>                         |
| <ul> <li>Smaller footprint than chlorination</li> <li>Effective against a wide range of micro-<br/>organisms.</li> <li>Does not produce harmful by-products.</li> </ul> | <ul> <li>Not very flexible to large variations in water quality.</li> <li>Requires building to house UV system.</li> </ul> |

#### Cost Comparison of Short Listed Disinfection Alternatives

Table 17 summarizes the results of the life-cycle cost analysis of the short-listed disinfection system alternatives. Estimates have been rounded to the nearest thousand dollars. Details of the life-cycle cost analysis can be found in Appendix C

#### Table 17 – Cost Estimate for Disinfection Alternatives

|                                       | Chlorination /<br>De-Chlorination | UV<br>Disinfection |
|---------------------------------------|-----------------------------------|--------------------|
| Capital Cost                          | \$1,761,000                       | \$785,000          |
| Annual Operation and Maintenance Cost | \$873,000                         | \$444,000          |
| Net Present Value                     | \$2,634,000                       | \$1,229,000        |

# 5.5 Development of Alternatives for Liquid Treatment Train

There were three short-listed primary/secondary treatment technologies and three short-listed tertiary treatment technologies. Evaluating all possible combinations of the short-listed technologies would require detailed analyses of nine different liquid train treatment alternatives, however not all combinations are applicable.

To further narrow down the feasible alternatives, a preferred tertiary treatment technology was identified and paired with the applicable, short-listed primary/secondary treatment technologies to create overall liquid train treatment alternatives for detailed analysis. It is noted that the selection of the MBR technology for secondary treatment would preclude the need for tertiary treatment.

The alternative used for disinfection does not depend on or affect the alternatives for primary/secondary or tertiary treatment and was excluded from development of the liquid treatment train alternatives.

#### 5.4.6 Detailed Evaluation of Tertiary Treatment Technologies

The weightings used for detailed analysis of the tertiary treatment alternatives were revised to more closely reflect the impacts related to the tertiary treatment system. At the point of tertiary treatment, the wastewater would be almost fully treated. Most of the solids and nutrients would be removed. Accordingly, it was decided that the Social/Cultural impacts of the tertiary treatment would not be as great as with the primary/secondary treatment and the weighting assigned to the Social/Culture criterion was reduced.

Weightings assigned to the Technical and Environmental criteria were increased to reflect the relative importance of these criteria for tertiary treatment.

Table 18 shows the criteria and weightings used to evaluate the tertiary treatment alternatives.

| Primary Criteria | Weight   | Secondary Criteria   | Weight |
|------------------|--|--|--------|
| Social / Culture | Social / Culture 5% Aesthetic Impacts (plant appeara |  | 10%    |
|                  |  | Traffic Impacts (during construction and operation)                              | 10%    |

#### 5.4.6.1 Preliminary Preferred Alternative for Tertiary Treatment

Based on the detailed evaluation of the short-listed tertiary treatment alternatives, tertiary membranes would be the preferred tertiary treatment alternative.

#### 5.4.7 Liquid Treatment Train Alternatives

The alternatives developed for treatment of the liquid train, using tertiary membranes as the tertiary treatment technology, are:

- Modified Conventional Activated Sludge with Tertiary Membranes
- Sequencing Batch Reactor with Tertiary Membranes
- Membrane Bioreactor

Note that the membrane bioreactor option does not require a tertiary treatment step, since it is capable of achieving the required effluent limits, with appropriate coagulant dosing for phosphorous removal.

# 5.6 Evaluation of Liquid Treatment Train Alternatives

#### 5.6.1. Cost Comparison of Liquid Train Treatment Alternatives

Table 20 summarizes the results of the life-cycle cost analysis of the three liquid treatment train alternatives, excluding disinfection, which is evaluated separately.

| NPV                                      | Modified<br>Conventional<br>Activated Sludge<br>with<br>Tertiary Membranes | Sequencing Batch<br>Reactor<br>with<br>Tertiary Membranes | Membrane<br>BioReactor |

# TOWN OF ERIN

#### COMMENTS

most tanks.

housed in a building.

to increased tankage (concrete trucks) and equipment required for each ue to chemical deliveries. MBR would have the least construction traffic as it rtiary building like the other two alternatives. MBR will have more frequent

orker health and safety and be due largely to blower operation. SBR would or runs intermittently. MBR has two sets of blowers that operate at run continuously.

e there are open tanks. CAS has the most open tankage, followed by SBR,

ame ability to meet regulatory objectives as they are all capable of meeting s slighly less sustainable.

st since its operating cycles can be adjusted to respond to changes in flows ose from septage addition. The MBR alternative is considered the least

amount of new construction due to the number of tanks to be expanded plus ve would require expansion of one tank plus the tertiary treatment. MBR otal footprint less than SBR expansion, but no expansion of a tertiary system ill buildout.

/d energy requirement.

n/d energy requirement.

h/d energy requirement.

and resulting operation and maintainance requirements. The SBR

MBR alternative has the advanced fine filter for primary treatment, reactor.

nt of land. The MBR option requires the least, since its tankage footprint is quire a tertiary treatment system/building.

ilure of the treatment systems, resulting in an environmental spill. MBR public health and safety since the plant would lose both secondary and ave the lowest impact since the increased number of tanks would provide

t sustainable since it can most consistantly meet the effluent requiements. stem in the future, which would make the plant more efficient by removing ive is more flexible to fluctuating influent conditions than the CAS ong term sustainability.

scored based on energy usage and amount of tankage/construction

The CAS and MBR alternatives have approximately equal energy est amount of tankage/construction. SBR has more tankage footprint than

result in the greatest impact to the natural environment, due to clearing of has the largest footprint, followed by the SBR alternative, and MBR has the

usage and biological efficiency. The MBR alternative has approximately 10% ternatives, which have approximately the same level of chemical usage.

#### 5.6.3. Preliminary Preferred Alternative for Liquid Treatment Train

Based on the detailed evaluation of the short-listed liquid treatment train alternatives, the preferred alternative is the Membrane Bioreactor system, which will perform secondary and tertiary treatment.

#### 5.6.4. Detailed Evaluation of Disinfection Alternatives

The evaluation criteria and weightings used for evaluating disinfection alternatives were those presented in section 5. Results of the evaluation are presented in Table 22.

#### Table 22 - Detailed Evaluation of Disinfection System Alternatives

#### 5.6.5. Preliminary Preferred Alternative for the Disinfection System

Based on the detailed evaluation of the short-listed disinfection system alternatives, the preferred alternative is UV disinfection.

# 5.7 Re-Oxygenation of Treated Effluent

#### 5.7.1 Objectives and Overview

Dissolved oxygen levels in the treated effluent must be a minimum of 4 mg/L to comply with the effluent limits. In order to achieve this, it will be necessary to include a re-oxygenation step just prior to discharge to the West Credit River to elevate the DO levels.

The re-oxygenation capacity required will vary depending on how much oxygen the liquid treatment train strips from the wastewater. However, for the purposes of this evaluation, it was assumed that the DO level in the treated wastewater will be approximately 2 mg/L, which is the minimum required DO level in the aerobic/biological stage and none of the short-listed secondary treatment alternatives or tertiary alternatives involve an anoxic or anaerobic step following the aerobic stage that will remove oxygen from the treated wastewater.

#### 5.7.2 Effluent Re-Oxygenation Technology Selection

Several alternatives to re-oxygenate the treated effluent were considered. The alternatives were:

- Coarse Bubble Aeration
- Fine Bubble Aeration
- Side Stream Dissolved Gas System
- Natural aeration via engineered waterfall from the WWTP to discharge point

Natural aeration was eliminated as it is not possible to readily calculate the amount of re-oxygenation that can be achieved using this method, which means there is no accurate way of sizing or pricing such a system. It also eliminates the ability to control the process and guarantee that the effluent limit is met.

The side stream dissolved gas system involves taking a side stream of the treated effluent, dissolving oxygen gas into the side stream and returning it to the main flow. The oxygen content in the side stream becomes distributed throughout the main flow and raises the DO levels. This alternative requires approximately 68 kg/day of oxygen. This is a large enough amount that an on-site oxygen storage facility would be needed. Additionally, the risks associated with handling oxygen gas make this alternative unattractive from an operator safety perspective and it was also eliminated from the evaluation.

Discussions with suppliers who have experience with effluent re-oxygenation systems revealed that fine bubble aeration is preferred over coarse bubble aeration, since fine bubble is a more efficient and cost-effective option. While fine bubble diffusers are more costly and have a shorter lifespan than coarse bubble diffusers, they have the lowest lifecycle cost due to the increased efficiency. For this re-oxygenation process, the treated wastewater will have less than 5 mg/L suspended solids and it is anticipated that this will greatly extend the life of the diffusers. In addition, fine bubble diffusers are recommended for the secondary treatment process and this selection provides the opportunity to streamline equipment selection.

The air required for re-oxygenation could be supplied from dedicated blowers or by increasing the capacity of the blowers used in the secondary treatment process. Preliminary sizing for dedicated blowers showed

that the required blower capacity was likely smaller than any available on the market. It was decided that it would be more practical and less costly to increase the size of the secondary treatment blowers to include the oxygen demand of the re-oxygenation process rather than using dedicated blowers.

Fine bubble aeration, using upsized secondary treatment blowers, was selected as the preferred alternative for re-oxygenating the effluent.

Table 23 presents the results of the life-cycle analysis for this process. Estimates have been rounded to the nearest thousand dollars. Details of the life-cycle cost analysis can be found in Appendix D.

#### Table 23 – Life-Cycle Costs of Effluent Re-Oxygenation

|                                       | Effluent Re-Oxygenation Costs |
|---------------------------------------|-------------------------------|
| Capital Cost                          | \$86,000                      |
| Annual Operation and Maintenance Cost | \$11,000                      |
| Net Present Value                     | \$97,000                      |

# 5.8 Preliminary Preferred Alternative for the Liquid Treatment Train

Based on the results of the detailed analyses of the alternatives for the liquid treatment processes, the preferred alternatives are:

- Primary, Secondary Treatment, and Tertiary Membrane Bioreactor (MBR)
- Disinfection UV Radiation (UV)
- Effluent Re-Oxygenation Fine Bubble Diffusers, using upsized secondary treatment blowers

Figure 7 presents the flow schematic for the preliminary preferred alternative for the liquid treatment train.

Figure 7 – Preferred Liquid Treatment Train Process Flow Schematic

# 6.0 Sludge/Biosolids Treatment and Management

## 6.1 **Objectives and Overview**

The objective of the sludge/biosolids component of the evaluation is to develop alternatives for treating and managing the sludge/biosolids generated at the WWTP.

Sludge/biosolids refers to the solids component in the wastewater. For the purposes of this assessment, sludge refers to wastewater solids that have not been stabilized and biosolids refers to wastewater solids that have been stabilized and are suitable for removal from the WWTP. Sludge does not include grit or solids that have been removed during preliminary treatment, as these solids are typically hauled off site for disposal at a landfill.

Sludge is progressively removed from the liquid stream during primary, secondary, and tertiary treatment. The quantity of sludge removed and/or generated in each process depends on the process itself. For example, processes that add coagulants to the liquid system will generate more sludge than processes that do not use coagulants.

Sludge from the WWTP is collected and can either be stabilized on site or hauled off-site for treatment by a biosolids management contractor. Sludge that is stabilized on site would be hauled off-site for use and/or disposal. If the sludge/biosolids were to be managed by a contractor, the contractor would choose the treatment and disposal methods.

Biosolids is a nutrient-rich product of the wastewater treatment process, with many options available for recovering and using the nutrients in a beneficial way, often termed as "beneficial reuse". Biosolids can be

treated by various methods to produce products that can be used agriculturally, commercially marketed, or used as an energy source. Some of the possible end-use options for biosolids include:

- Applied to agricultural land as fertilizer;
- Used as a soil amendment, such as with compost;
- Commercially marketable fertilizer;
- Incinerated for heat and the ash used in the cement industry.

## 6.2 Sludge/Biosolids Train Evaluation Methodology

Several factors were considered when developing a management strategy for the sludge/biosolids generated. Factors considered included:

- Whether or not to stabilize the sludge on site or have unstabilized sludge hauled off-site for treatment and disposal at another facility,
- What on-site stabilization technology to use, and
- To what level should the biosolids be processed for beneficial re-use and/or commercial marketing.

#### 6.2.1 Alternatives Related to Hauling Unstabilized Sludge Off-Site

Alternatives involving management /disposal of unstabilized sludge involve performing no on-site sludge stabilization. Unstabilized sludge would be hauled off-site for either disposal or treatment by another party.

The alternatives considered for management of unstabilized sludge were:

- Disposal at a landfill, licensed to accept unstabilized sludge;
- Treatment at another municipal facility, and
- Treatment/disposal by an independent, Biosolids Management Contractor.

All alternatives involving disposing or hauling unstabilized sludge off site were considered not sustainable as they carry a high degree of risk due to dependence on the receiving facility. Specifically, if the receiving facility were unable to accept Erin's unstabilized sludge, Erin would have no alternate means of disposing of the unstabilized sludge. The ability to expand Erin's plant would hinge on whether or not the off-site receiving facility has spare capacity to accept additional sludge. Alternatives related to hauling unstabilized sludge off-site were eliminated from the evaluation.

#### 6.2.2 Alternatives Related to On-Site Sludge Stabilization

Unlike unstabilized sludge, stabilized sludge can be readily land applied to suitable agricultural lands. There are numerous contractors that offer land application services. End-use options related to stabilized sludge do not carry the same risk of dependence on a third part as alternatives related to unstabilized sludge.

Due to the flexibility associated with stabilizing the plant's sludge on site, it was decided that this alternative would serve the Town well and a long-list/short-list evaluation, as described previously in Section 4, was performed for sludge stabilization technologies. The evaluation and its results are presented in Section 7.3.

#### 6.2.3 Alternatives Related to Revenue Generation from Biosolids

Biosolids can be processed to a level where they are suitable for commercial marketing and generate revenue. Typically, additional treatment systems are required after the sludge stabilization stage to produce a biosolids end-product of quality that matches the regulations as a commercially marketable product.

There are two options available for generating a marketable biosolids product. The first option consists of constructing an on-site treatment system then independently marketing the biosolids product. The second option is to retain the services of an independent Biosolids Management Contractor that would haul the stabilized sludge from the wastewater plant to their facility for treatment, after which the Contractor would market the biosolids product and return a portion of the revenue to the Town. The first alternative would require the capital expenditure of constructing a biosolids processing system, but would have the benefit that 100% of the revenue would go to the Town. The second alternative would not require the Town to finance the construction and operation of the biosolid treatment system. However, only a portion of the revenues would come back to the Town.

In either case, the amount of revenue generation possible depends on market conditions at the time of production and the amount of biosolids product available for marketing. It is difficult at this time to accurately predict what market conditions will be following Phase 1 construction. Also, the amount of sludge/biosolids generated by the plant depends on the characteristics of the raw wastewater and the treatment technologies implemented at the wastewater treatment plant.

Due to the degree of uncertainty this stage of the project with the major variables required to assess the cost benefits of producing a commercially marketable biosolids product, a long-list/short-list evaluation was not performed for revenue generation options. Instead, it is recommended that this evaluation be conducted after Phase 1 is operating and when the sludge production and quality will be known.

Section 7.4 presents an overview of the technologies available for processing biosolids to a level of commercial marketability and discusses the advantages and disadvantages of each.

Limiting the solution to generating stabilized sludge until marketability of the biosolids can be accurately assessed will provide the Town with a sufficiently secure solution for Phase 1 and incorporates a conservative approach to the cost estimate for the whole plant.

# 6.3 Evaluation of On-Site Sludge Stabilization Technologies

The methodology used to evaluate the technologies available for on-site sludge stabilization was a modified version of that used for the liquid train evaluation. A long-list set of screening criteria, specific to sludge/biosolids, was developed and used to short list the technology alternatives. This approach was used because the objectives for sludge/biosolids management vary from those associated with the liquid train. For example, the ability for beneficial reuse is a criterion that is specific to sludge/biosolids and is not relevant to the liquid treatment process.

#### 6.3.1 Long-List Screening Criteria

The criteria selected for screening the long list of sludge stabilization technologies are presented in Table 24 and descriptions of each criterion follow.

#### Table 24 - Sludge Stabilization Short-List Screening Criteria

| Criteria                                  | Description  |
|---|--|
| Regulatory Compliance                     | Ability to meet current and anticipated future regulations for processing and end-use / disposal.  |
| Proven Reliability and Sustainability     | Demonstrated successful projects of similar size and high level of flexibility to variations in sludge/biosolids quality and adverse weather conditions. |
| Staging / Phasing                         | Ability to easily expand to meet Erin WWTP's Full Buildout capacity.   |
| Cost                                      | Have value in terms of performance and/or operation and maintenance that are reflective of the capital costs.  |
| Resource Recovery /<br>Revenue Generation | Ability for end product to be used beneficially (e.g. land application) or to generate revenue (e.g. sold commercially as compost or fertilizer)         |

#### Regulatory Compliance

In order for an alternative to be carried forward for detailed analysis, the alternative must be one that produces a final product that meets the current and anticipated regulations for the intended use of the end product. For example, processes that produce compost must be able to adhere to the stringent metals content as prescribed by the Guidelines for the Production of Compost in Ontario, if the compost is to be commercially marketed in Ontario.

#### Proven Reliability and Sustainability

The preferred alternative must have a demonstrated history of reliably processing biosolids from a facility or facilities of a similar scale. The preferred alternative must be sustainable and be able to provide year-round treatment and/or storage, where required.

#### Staging/Phasing

The staging / phasing criterion reviews how easily an alternative can be expanded to match the planned expansion of the facility. Alternatives that require minimal component upgrades and financial investment were rated more favourably.

#### Cost

The cost criterion looks at the capital cost of the alternative and the costs associated with its operation and maintenance. Capital costs involve all initial construction costs including equipment purchase and installation. Operation and maintenance aspects include costs related to utilities (electricity, gas, potable water), chemicals, and the level of effort required for regular maintenance of the equipment.

#### Beneficial Use / Revenue Generation

This criterion relates to whether or not the final product produced by the alternative can be beneficially reused and/or commercially marketed. Alternatives that do not provide nutrient recovery or revenue generation from biosolids are excluded from the short-list.

#### 6.3.2 Short-List Screening Criteria

The short-list screening criteria applied to the sludge stabilization technology alternatives were those used for the liquid train evaluation as they were considered relevant to both processes. Refer to section 4 for a list of the criteria and their descriptions.

#### 6.3.3 Short-Listing of Sludge Stabilization Alternatives

The long list of alternatives considered for sludge stabilization technologies and the rationale used for shortlisting are presented in Table 25.

### Table 25 – Evaluation of Long List of Sludge Stabilization Technology Alternatives

|      |                        |   |                          |   | Screening C          |      |   |                  |   |

#### 6.3.4 Summary of Short-Listed Sludge/Biosolids Alternatives

The on-site sludge stabilization technologies that were short-listed for detailed evaluation were:

- Aerobic Digestion
- Auto-Thermal Thermophilic Aerobic Digestion (ATAD)

#### 6.3.5 Detailed Description of Short Listed Sludge Stabilization Alternatives

#### Alternative 1: Aerobic Digestion

Figure 8 shows a flow schematic of the process steps associated with the aerobic digestion alternative. Sludge and scum from the liquid train are directed to the aerobic digester, which is equipped with an aeration and mixing systems.

Figure 8 – Conventional Aerobic Digester Process Flow Schematic

Stabilized sludge is pumped from the digester to the biosolids thickening tank at approximately 1.5% solids. Polymer is added to the thickening tank, which is equipped with a mixing system to allow the polymer to react with the biosolids. From the thickening tank, the biosolids is pumped to the biosolids settling tanks.

The biosolids settling tank provide quiescence for settling and will be equipped with decanting systems to facilitate gravity thickening. Decanted liquid from the biosolids settling tank will be pumped to the head of the plant and thickened biosolids will be pumped to the biosolids storage tanks.

During summer months, thickened biosolids is pumped from the biosolids storage tanks then to the haulage trucks and hauled off-site for land application.

This alternative involves land applying of the biosolids as a liquid product rather than a biosolids cake, so the biosolids will need to be thickened to no more than 6%, as pumping of biosolids beyond this concentration, using traditional sludge pumps, becomes problematic. It is anticipated that thickening via polymer addition and gravity settling will achieve the desired solids concentration.

Advantages and disadvantage of this alternative are presented in Table 26.

#### Table 26 – Advantages and Disadvantages of the Aerobic Digestion Alternative

| Advantages   | Disadvantages  |  |  |  |
|--|--|--|--|--|
| <ul> <li>Requires simplest thickening system.</li> </ul>         | <ul> <li>Higher operation costs due to requirement of</li> </ul>       |  |  |  |
| <ul> <li>Least amount of process equipment required.</li> </ul>  | aeration.  |  |  |  |
| <ul> <li>Biosolids produced is relatively odour-free.</li> </ul> | <ul> <li>Degree of stabilization is weather dependent, with</li> </ul> |  |  |  |
| <ul> <li>Well understood technology.</li> </ul>                  | lower levels seen in the colder months.                                |  |  |  |

#### Alternative 2: Auto-Thermal Thermophilic Aerobic Digestion (ATAD)

Figure 9 presents a flow schematic of the steps associated with the ATAD alternative. Unlike Alternative 1, sludge and scum cannot be pumped directly to the ATAD. It needs to be thickened to approximately 5% solids.

#### Figure 9 – ATAD Process Flow Schematic

From the liquid train, sludge and scum are pumped to an equalization tank then to a mechanical thickener. Polymer is added to the mechanical thickening process to improve thickening. Since sludge fed to the ATAD must be at a prescribed solids concentration, mechanical thickening is incorporated in this alternative to ensure that the required solids concentration can be achieved in a reasonable length of time.

Thickened sludge is then pumped to the ATAD for stabilization. The ATAD unit can be a single stage or double stage digestion system. A single stage process achieves sludge stabilization and the product is suitable for land application. If followed by a second stage, the second stage pasteurizes the biosolids to a quality level where the biosolids can be used as fertilizer without restrictions, as compared to land application only with the single stage ATAD. However, the pasteurized end-product has a lower nitrogen content, potentially making them a less desirable product in areas where high ammonia nitrogen fertilizer is desired.

From the ATAD, biosolids are transferred to biosolids holding/cooling tank, where excess heat from the stabilization process is removed to avoid possible over-heating.

Biosolids from the holding/cooling tank are pumped to the biosolids storage tanks, which provide the required 240 days of storage.

Advantages and disadvantage of this alternative are presented in Table 27.

#### Table 27 – Advantages and Disadvantages of the ATAD Alternative

| Advantages  | Disadvantages   |
|---|---|
| <ul> <li>Smaller digester size due to shorter retention times.</li> </ul>                 | <ul> <li>Higher capital costs due to requirement for<br/>mechanical thickening system.</li> </ul>   |
| <ul> <li>Degree of stabilization is not weather<br/>dependent.</li> </ul>                 | <ul><li>Slightly more complex operation.</li><li>Biosolids product have higher odour than</li></ul> |
| <ul> <li>Can produce a pasteurized biosolids product<br/>if second stage used.</li> </ul> | conventional aerobic digestion – odour control<br>system may be needed.                             |

#### 6.3.6 Cost Comparison of Short Listed Sludge Stabilization Alternatives

Table 28 summarizes the results of the life-cycle costs analysis for the sludge stabilization alternatives. Details of the life-cycle cost analysis can be found in Appendix E.

#### Table 28– Cost Estimates for Sludge Stabilization Alternatives

#### 6.3.8 Preliminary Preferred Alternative for Sludge Stabilization

Based on the detailed evaluation of the short-listed sludge stabilization alternatives, stabilization by autothermal thermophilic digestion (ATAD) and land application of liquid biosolids would be the preferred alternative.

# 6.4 **Options for Revenue Generation**

The amount of revenue generation that is possible from commercial marketing biosolids produced at the wastewater treatment facility is dependent on the following parameters:

- Quantity of the biosolids.
- Characteristics of the biosolids (nutrient profile).
- Market value of the biosolids end-product at the time of marketing
- The life-cycle costs associated with the technology used to produce the biosolids product.

Once Phase 1 of the Erin WWTP is in operation, the first three variables listed above will be known and a life-cycle analysis will be feasible to determine if revenue can be generated.

Commercially marketable biosolids are either fertilizers or soil amendments, such as compost. There are several viable technologies that produce a biosolids product that can be marketed in Ontario. The following is a description of a few of these technologies, along with the advantages and disadvantages of each.

#### 6.4.1 Thermal Drying

Thermal drying involves heating the biosolids to further reduce its pathogen levels, reduce its water content to almost zero, and achieve the quality required for commercial marketing. The end-product is a pelletized fertilizer which is approved for unrestricted use. The fertilizer pellets can be sold for residential use, such as direct application to lawns or gardens. The can also be directly applied in public areas, used as agricultural amendments, or mixed with other ingredients prior to application.

Heating can be either direct heating or indirect. Technologies used for thermal drying include rotary dryers, fluidized beds, hollow-flight dryers, and steam dryers. This option would require incorporating a thickening system upstream of the thermal dryer to reduce the water content from approximately 96% to 75%, thus reducing the amount of energy required to dry the biosolids.

In addition, a cooling system will be needed to prevent ignition of the dried pellets when they are being stored.

Table 30 presents the advantages and disadvantages of thermal drying.

#### Table 30 – Advantages and Disadvantages of Thermal Drying

| Advantages   | Disadvantages   |
|--|---|
| <ul> <li>Fertilizer product is high in nutrients, such as nitrogen and phosphorous – increased value as fertilizer</li> <li>Product easily packed for marketing.</li> <li>Small footprint compared with other technologies.</li> <li>Achieves the highest volume reduction (pellets are at least 90% solids) – reduced trucking traffic.</li> <li>Does not require the addition of chemicals or other agents – reduced traffic to facility.</li> </ul> | <ul> <li>Higher energy consumption.</li> <li>High capital cost.</li> <li>Dust generated in drying process creates an explosion hazard.</li> <li>Systems are complex and require skilled operations staff.</li> <li>Potential for odours.</li> </ul> |

#### 6.4.2 Solar Drying

Solar drying also involves stabilization of the biosolids with heat. However, solar drying uses the sun's energy as the heat source. Stabilized sludge is spread across the floor of drying greenhouses, where the heat of the sun stabilizes and dries the biosolids. The greenhouses are equipped with a mechanical system to mix and turn the biosolids bed while gradually moving biosolids from the inlet end of the greenhouse to the discharge end. The end-product is a pelletized fertilizer which is approved for unrestricted use.

A thickening system will be needed upstream of the solar dryer to reduce the water content in the biosolids. A pellet cooling system may not be required with this technology since the heat applied for drying is significantly less than with traditional thermal drying technologies.

Since the heat applied is low compared to traditional thermal drying technologies, the process takes longer and, thus requires a large footprint to expose all of the biosolids to the sun.

This technology would incorporate supplemental heating to provide heat during the winter months where there is reduced levels of sunlight and the ambient temperature is low.

Table 31 presents the advantages and disadvantages of solar drying.

#### Table 31 – Advantages and Disadvantages of Solar Drying

| Advantages  | Disadvantages   |
|---|---|
| <ul> <li>Reduced energy costs compared to traditional<br/>thermal drying methods.</li> </ul>  | <ul> <li>Large footprint.</li> <li>Requires supplemental heating for periods of low-</li> </ul> |
| <ul> <li>Fertilizer product is high in nutrients, such as<br/>nitrogen and phosphorous – increased value<br/>as fertilizer</li> </ul> | sunshine <ul> <li>Potential for fugitive odours</li> </ul>                                      |
| <ul> <li>Product easily packed for marketing.</li> </ul>  |   |
| <ul> <li>Does not require the addition of chemicals or<br/>other agents – reduced traffic to facility.</li> </ul>                     |   |

#### 6.4.3 On-Site Composting

Composting is a process in which organic material undergoes biological degradation, generating a stabilized end product. The composting process naturally heats the material by microbial decomposition to temperatures of 50 to 65°C. At this temperature range, pasteurization of the biosolids will take place.

Typically, bulking agents are added to the biosolids to improve the structural integrity of the mixture. Bulking agents can be wood chips, straw, or sawdust. Other organic composting materials are possible, such as food scraps, yard trimmings, and paper products. The choice of bulking agent is dictated by the type of composting used.

There are three major types of composting: aerated windrow composting, aerated static pile composting, and in-vessel composting. Aerated windrow composting and aerated static pile involve making piles or windrows of the material to be composted and aerating it to support the micro-organisms that decompose the material. In windrow composting the composting piles are mixed, whereas in aerated static pile composting the composting the composting the composting piles are mixed.

The mixing in windrow composting tends to release odours. To control fugitive odours, windrows can be covered with a semi-permeable geotextile material, which allows the passage of oxygen molecules but prevents passage of larger molecules, including odorous compounds.

In-vessel composting is performed within an enclosed container (tank, silo, concrete lined trench, etc.). The vessel includes mixing to keep the material aerated. In-vessel composting is versatile in that it can accept almost any type of organic waste (meat, animal manure, biosolids, food scraps). Other advantages include less potential for nuisance odours, smaller footprint than other composting methods, and faster processing times.

Table 32 presents the advantages and disadvantages of on-site composting.

| Advantages  | Disadvantages   |
|---|---|
| <ul> <li>Reduced energy costs compared to other</li> </ul>  | <ul> <li>Large footprint.</li> </ul>  |
| stabilization methods.  | Precipitation can slow down the degradation   |
| <ul> <li>High level of flexibility, robustness, and lower<br/>labour costs possible with in-vessel</li> </ul> | process of organics due to excessive moisture<br>and evaporative cooling (except for in-vessel) |
| composting method.  | High potential for fugitive odours (except for in-  |
| <ul> <li>Compost product marketable, especially to</li> </ul>   | vessel).  |
| local residents.  | <ul> <li>Windrow and static pile are labour intensive.</li> </ul>                               |

#### Table 32 – Advantages and Disadvantages of On-Site Composting

#### 6.4.4 Retain Services of a Biosolids Management Contractor

Currently, there are two companies in Ontario that provide biosolids management services, including commercial marketing of the biosolids end-product. The two companies are Lystek International and Walker Industries. Both companies use alkaline stabilization to produce a commercially marketable fertilizer product.

The option of retaining the services of a biosolids management contractor means that the contractor would use their privately-owned stabilization system and then market the end-product through their marketing network. A portion of the revenue generated from sales would be returned to the Town.

Both contractors can process either unstabilized or stabilized sludge in their systems and can include haulage of the sludge/biosolids from the Town's wastewater treatment facility to their processing plant in their services. These contractors require that the hauled sludge/biosolids be at a minimum solids concentration between 15% and 20%.

The Town would have to construct a biosolids thickening facility to achieve the higher solids concentration required for haulage.

The amount of revenue generation possible with this option will depend on market conditions at the time of production, sludge/biosolids quality, sludge/biosolids quantity produced. The Town may need to issue a call for proposals for potential contractors to assess which contractor can offer the greater value.

Table 33 presents the advantages and disadvantages of on-site composting.

#### Table 33 – Advantages and Disadvantages of Biosolids Management Contractor

| Advantages   | Disadvantages  |
|--|--|
| <ul> <li>Town would not have to finance construction<br/>and operation of a biosolids processing<br/>facility</li> </ul> | <ul> <li>Town would not receive 100% of profits from<br/>biosolids product sales.</li> </ul> |
| <ul> <li>Town would not to have manage marketing of<br/>biosolids end-product.</li> </ul>                                | <ul> <li>Town would be relying on a third-party.</li> </ul>                                  |

#### 6.4.5 Recommendations

It is recommended that a Biosolids Options Study be performed after Phase 1 is in operation to assess the profitability of moving towards marketing the biosolids produced by the Town's wastewater treatment facility. Sludge quantity and quality will be known once Phase 1 is in operation. Assessments that may affect Phase 2 can be performed with the more accurate information gained from Phase 1 operations.

It may be of value to consider implementing a county-wide biosolids processing facility and benefiting from the economies of scale that such a system could provide.

# 7.0 Septage Management

### 7.1 Objectives and Overview

Current residents who are outside the recommended service area of the proposed wastewater collection system will remain on septic systems. To provide service to these residents, Erin's WWTP will include a septage receiving and management system.

Treatment of septage is challenging because septage is significantly stronger than domestic sewage. The MOECC cites that BOD and total phosphorous levels in septage are on average thirty-six times higher than in domestic sewage. Other parameters can be as high as seventy times higher.

For wastewater treatment plants with larger flows, septage can be added to the main treatment process without negatively impacting the performance of the plant, as the dilution by the large plant flow buffers

loadings from septage. However, for smaller treatment facilities, such as Erin's, addition of even small amounts of septage to the main treatment process could result in overloading of the treatment processes.

Where septage is added to the main treatment process, the rate of addition has to be carefully controlled to respond to instantaneous plant flows in order to prevent system overload.

## 7.2 Septage Flows

There are an estimated 2,500 existing, rural residents who will remain on septic systems. The estimated growth rate of this rural population is 0.5% per year. Over this next twenty years, the number of residents using septic systems will increase to approximately 2,762.

The estimated septage flow for the existing rural residents is 2,500 m<sup>3</sup>/year, projected to increase to 2,762 m<sup>3</sup>/year by the year 2038.

Septage flows to the treatment facility and population served are presented in Table 34.

#### Table 34 – Estimated Septage Flow to Erin WWTP

|   | 2018  | 2038  |
|---|-------|-------|
| Number of Rural Residents Using Septic Systems          | 2,500 | 2,762 |
| Annual Septage Flow to the WWTP (m <sup>3</sup> / year) | 2,500 | 2,762 |
| Estimated Daily Flow to the WWTP (m <sup>3/</sup> d)    | 9     | 10    |

The above flow rates were used in evaluating feasible alternatives for septage management and it was assumed that the plant will accept septage only from residents of the Town of Erin.

Since the projected increase in septage flow for the next 20 years is less than 1  $m^3/d$ , it would be practical and cost effective to design the septage receiving and management system in Phase 1 to accommodate 2018 flows.

## 7.3 Septage Characteristics

The septage characteristics used in the evaluation of septage management alternatives for Erin were the suggested design values as cited in the MOE Design Guidelines for Sewage Works, Chapter 9 (Co-Treatment of Septage and Landfill Leachate at Sewage Treatment Plants), and are listed in Table 35.

It should be noted that characteristics of septage received at the WWTP may vary widely, since septage haulers collect septage and waste from differing sources in addition to septic tanks, including construction and temporary toilets for special events. Once Erin's WWTP starts to receive septage, the septage can be tested to determine its specific characteristics and the septage management system can be adjusted accordingly.

#### Table 35 – Raw Septage Characteristics

| Raw Septage Parameter          | MOE Suggested<br>Design Value<br>(mg/L) |
|--------------------------------|---|
| Biological Oxygen Demand (BOD) | 7000                                    |
| Total Suspended Solids (TSS)   | 15,000                                  |
| Total Kjeldahl Nitrogen (TKN)  | 700                                     |
| Total Ammonia Nitrogen (TAN)   | 150                                     |
| Total Phosphorous (TP)         | 250                                     |
| Alkalinity                     | 1000                                    |

## 7.4 Overview of Septage Management Approaches

Three approaches were considered for management and treatment of septage at the wastewater treatment facility. The approaches are:

- Co-Treatment
- Pre-Treatment Followed by Co-Treatment
- Separate Treatment

#### Co-Treatment

Co-Treatment is the addition of raw septage to the WWTP's treatment process. Raw septage can be treated as either part of the plant's liquid or solid treatment system. This approach requires either careful monitoring or metering of the septage addition rate to ensure that the plant does not become overloaded or suffer system shock or designing the main treatment plant to be capable of treating the expected septage flows. Co-treatment is typically used in larger wastewater treatment facilities.

#### Pre-Treatment Followed by Co-Treatment

Pre-treatment followed by co-treatment involves partially treating the raw septage to reduce its strength prior to adding it to the main plant. This reduces the loading to the plant and has the added benefit of allowing the plant to accept and treat more septage. This approach is typically used in smaller wastewater treatment facilities.

#### Separate Treatment

Separate treatment involves treating the septage via a dedicated system to a level that matches the WWTP's effluent characteristics. This approach is not widely used since it tends to add significant capital cost to the plant or require a large amount of land, in the case of treatment via lagoons.

The alternatives considered in the evaluation of septage management were chosen based on the preferred technology alternative for the main treatment plant. If the preferred alternative for the treatment plant is changed then evaluation of the septage management alternatives may need to be revisited.

# 7.5 Septage Management Evaluation Criteria

#### 7.5.1 Long-List Screening Criteria

The criteria selected for the long-list screening of the septage management alternatives are presented in Table 36.

#### Table 36 – Septage Management Long-List Screening Criteria

| Criteria                                     | Description   |
|--|---|
| Proven Reliability                           | Demonstrated track record of consistently meeting treatment objectives for septage.                           |
| Potential for Upset to Main Plant<br>Process | The likelihood that this process would lead to an upset in the main plant's ability to meet effluent limits.  |
| Site Requirements (footprint)                | Amount of land required for the technology.   |
| Potential for Odours                         | Likelihood of the alternative to generate odours at an unacceptable level during normal operation.            |
| Cost   | Have value in terms of performance and/or operation and maintenance that are reflective of the capital costs. |

#### Proven Reliability

In order for an alternative to be carried forward for detailed analysis, the alternative must be one that achieves the required level of treatment for that particular alternative. For example, an alternative that would treat the septage independently from the plant would need to have a proven history of achieving the removal rates set out for the plant. However, an alternative that involves partially treating the septage before adding it to the main plant would only need to achieve a certain, prescribed level of treatment.

#### Potential for Upset to the Main Plant Process

This criterion reviews the impact that the septage management alternative might have on the main treatment process. Alternatives that treat the septage independently from the main plant would score higher as they would not contribute to the plant loadings. Alternatives that either add raw septage or partially treated septage to the plant would be scored according to the impact on the main plant process in the event of a septage system upset.

#### Site Requirements

Site requirements relate to the space that will be needed for the alternative as compared to the space available at the site for this system.

#### Cost

This cost criterion looks at the capital cost of the alternative and the costs associated with its operation and maintenance. Capital costs include equipment purchase and installation. Operation and maintenance

aspects include costs related to utilities (electricity, gas, potable water), chemicals, and the level of effort required for regular maintenance of the equipment.

#### 7.5.2 Short-List Screening Criteria

The criteria selected as the septage management short-list criteria are presented in Table 37. Descriptions of each criterion can be found in section 5.2.2.

| Primary Criteria | Weight | Secondary Criteria   | Weight |
|------------------|--------|--|--------|
| Social / Culture | 10%    | Aesthetic Impacts (plant appearance)   | 10%    |
|                  |        | Traffic Impacts (during construction and operation)                              | 10%    |
|                  |        | Noise Impacts (during operation)   | 40%    |
|                  |        | Odours Impacts (during operation)  | 40%    |
| Technical        | 40%    | Ability to Meet Treatment Objectives and Robustness                              | 30%    |
|                  |        | Potential for Upset to Main Plant Process  | 40%    |
|                  |        | Energy Requirements  | 10%    |
|                  |        | Operation & Maintenance Requirements (simplicity, operator skill level/quantity) | 10%    |
|                  |        | Site Requirements (plant footprint)  | 10%    |
| Environmental    | 20%    | Public Health and Safety 3   |        |
|                  |        | Sustainability   | 25%    |
|                  |        | Climate Change Impacts / Greenhouse Gas<br>Generation                            | 25%    |
|                  |        | Natural Environment Impacts  | 15%    |
| Economic         | 30%    | Capital Cost   | 30%    |
|                  |        | Operation and Maintenance Costs  | 40%    |
|                  |        | Net Present Value  | 30%    |

Table 37 – Septage Management Short-List Screening Criteria

## 7.6 Evaluation of Septage Management Alternatives

#### 7.6.1 Short-Listing of Sludge Stabilization Alternatives

The long list of alternatives considered for septage management and the rationale used for short-listing are presented in Table 38.

#### Table 38 – Evaluation of Long List of Septage Management Technologies

|     |   |   |                 | Screening Criteria              |                           |                            |      |                  |   |
|-----|---|---|-----------------|---------------------------------|---------------------------|----------------------------|------|------------------|---|
| No. | Technology  | Description   | Track<br>Record | Potential<br>for Plant<br>Upset | Site<br>Require-<br>ments | Potential<br>for<br>Odours | Cost | Carry<br>Forward |   |
| 1   | Direct Co-Treatment in<br>Main Treatment Plant<br>Process                       | Raw septage would be received at a septage receiving/storage station<br>and pumped to the main plant for treatment as part of the liquid<br>treatment train. The flow of septage to the treatment plant would need<br>to be controlled to prevent shock loading or overloading of plant<br>treatment systems.   | ~               | ✓                               | ✓                         | ✓                          | ~    | Yes              | : |
| 2   | Stabilization Pond / Lagoon   | This is a separate treatment alternative that would involve constructing<br>a treatment lagoon/pond system at the site to receive and treat raw<br>septage. Treated septage would then be disposed of off-site via land<br>application.   | X               | ✓                               | X                         | X                          | ~    | No               | • |
| 3   | Pre-Treat Raw Septage by<br>Dewatering with GeoTube<br>Followed by Co-Treatment | Raw septage would be received at a septage receiving station from<br>where it would be pumped into permeable tubes (GeoTubes) for<br>dewatering. Filtrate from the GeoTubes would be collected and<br>pumped into the plant for co-treatment. The filtrate would be<br>significantly weaker than raw septage, reducing the risk of plant<br>overload and potentially increasing the facility's septage treatment<br>capacity. The dewatered septage solids would be disposed of off-site<br>via land application. | ~               | ~                               | ~                         | <b>√</b>                   | ~    | Yes              | • |
| 4   | Design Preferred Main<br>Plant's MBR System to<br>Include Septage Treatment     | This alternative involves increasing the plant's treatment capacity to process the increased loading from septage. Raw septage would be received at a septage receiving station then pumped to the plant for treatment. The flow of septage to the treatment plant would need to be controlled to prevent shock loading or overloading of the plant's treatment systems, in the event that the septage characteristics are stronger than the design values.   | ~               | √                               | $\checkmark$              | √                          | ~    | Yes              | • |
| 5   | Separate Treatment via<br>Dedicated Treatment<br>Process                        | This alternative involves incorporating a separate treatment system at<br>the wastewater facility to treat the raw septage to meet the plant's<br>effluent limits.  | X               |                                 | <b>√</b>                  | ✓                          | X    | No               | • |

# ERIN

#### Rationale

- This a common practice in Ontario for septage management Has the highest potential for plant upset if not managed properly.
- Low foot print as only a septage receiving station would be needed
- Low potential for odours if receiving tanks are covered. Lower cost compared to other alternatives as only the
- septage receiving/storage station would be required
- Ability to achieve advanced TAN removal is questionable No possibility of plant upset, since septage would be treated independently
- Requires larger amount of land
- High potential for odours as lagoon would be open to atmosphere
- Costs are comparable with other alternatives
- Dewatering as a pre-treatment is a common practice
- Low potential for plant upset
- Land requirements can be met
- Odour control incorporated into system
- Costs are comparable with other alternatives

MBR is a proven technology

- Some potential for plant upset if septage characteristic are significantly stronger than system is designed to treat MBR biological reactor tank size will increase slightly Costs are comparable with other alternatives.
- All technologies investigated are emerging without a track record for advanced nutrient removal from septage. Required phosphorous removal is challenging.
- No possibility of plant upset, since septage would be treated independently
- Land requirements can be met
- The systems considered were enclosed. Odour control
- systems can be included for the enclosure.
- Capital costs are high compared with other alternatives.

#### 7.6.2 Summary of Short-Listed Septage Management Alternatives

The septage management alternatives that were short-listed for detailed evaluation were:

- Direct Co-Treatment of Raw Septage
- Design Main Plant's MBR process to Include Septage Treatment
- Pre-Treat Raw Septage by Dewatering with GeoTube Followed by Co-Treatment

#### 7.6.3 Detailed Description of Short Listed Sludge Stabilization Alternatives

#### Alternative 1: Direct Co-Treatment of Raw Septage

Alternative 1 involves receiving raw septage at a septage receiving station and pumping it to the main plant for treatment as part of the liquid train. The septage receiving station would be a common system for all septage management alternatives considered and would include a bar screen and a septage holding tank. The bar screen would be designed to remove larger objects, rags, and other items that would be difficult to pump. The septage holding tank would store raw septage and submersible raw septage pumps would pump septage to the head of the main plant for co-treatment at an even, metered flow rate.

Raw septage would be introduced to the plant at the headworks area to allow mixing with the domestic sewage prior to the biological treatment stage. Since septage is significantly stronger than domestic sewage, the rate at which raw septage is pumped to the plant will need to carefully controlled to prevent shock-loading or overloading the plant's treatment processes.

Using the septage characteristics listed in section 8.3, at the plant's Phase 1 average flow of 4,780 m<sup>3</sup>/d, raw septage could be added to the plant at approximately 6 L/min before the plant's influent characteristics would rise above the average range for domestic sewage. Additionally, the septage pumping rate would need to be modulated to mirror fluctuations in plant's instantaneous flow rate. Raw septage flow to the plant would need to be kept below 0.19% of the plant's instantaneous flow in order to prevent system overload.

A septage addition rate of 6 L/min equates to adding 9 m<sup>3</sup> (one small haulage truck) over a 24-hour period. It is proposed that two septage holding tanks be provided (standby and backup) and each tank sized to contain two day's worth of septage.

Advantages and disadvantage of this alternative are presented in Table 39.

| Advantages   | Disadvantages   |
|--|---|
| Least costly alternative   | <ul> <li>Highest potential for upset to main plant process</li> </ul>   |
| <ul> <li>Small footprint, since only the septage<br/>receiving station and holding tank would be<br/>required</li> </ul> | <ul> <li>Requires frequent operator involvement to<br/>analyze septage characteristics and determine<br/>acceptable transfer rate to main plant.</li> </ul> |
|  | <ul> <li>Difficult to plan for variability of septage arrival at<br/>the WWTP.</li> </ul>   |
|  | No potential to expand for revenue generation.  |

#### Table 39 – Advantages and Disadvantages of Direct Co-Treatment

#### Alternative 2: Design Main Plant's MBR to Include Septage Treatment

Alternative 2 involves designing the plant's preferred secondary treatment technology (membrane bioreactor) to accommodate the increased loading from septage. The increase in design capacity would be to a level where the MBR could achieve the required treatment up to the point where addition of septage would drive the plant's influent characteristics above the average range for domestic sewage.

Raw septage would be received at the septage receiving station, stored in a septage holding tank, and pumped to the plant for treatment when the tank is full. The flow of septage to the treatment plant would need to be controlled to prevent shock loading or overloading of the plant's treatment system.

Using the septage characteristics in section 8.3, it is estimated that this alternative could accommodate a septage addition rate up to 0.42% of the plant's instantaneous flow. At the plant's Phase 1 average flow rate of 4,780 m<sup>3</sup>/d, this septage addition rate equates to 14 L/min.

Advantages and disadvantage of this alternative are presented in Table 40.

#### Table 40 – Advantages and Disadvantages of Increasing the Capacity of the Main Plant

| Advantages   | Disadvantages                                       |
|--|---|
| <ul> <li>Minimizes potential for plant upset compared</li> </ul> | <ul> <li>Potential for upset fairly high</li> </ul> |
| to direct co-treatment   | No potential to expand to achieve revenue           |
| <ul> <li>Slight increase in bioreactor size</li> </ul>           | generation, if desired.                             |

#### Alternative 3: Pre-Treat Raw Septage by Dewatering with GeoTube Followed by Co-Treatment

Alternative 3 involves pre-treating the raw septage using a permeable membrane tube (Geotube) dewatering system and pumping the dewatering filtrate to the head of the main plant for co-treatment. The solids component of the dewatering operation would become stabilized in the Geotube and the stabilized product would be suitable for land application.

Pre-treatment decreases the strength of the raw septage, thus reducing the potential for shock-loading or overloading of the main plant and potentially increasing the plant's septage treatment capacity.

As with alternative 1, raw septage would be received at the septage receiving station and stored in the septage holding tank. Submersible pumps would pump the raw septage into the Geotube for dewatering on a batch basis for each tube. The Geotubes would be installed on an engineered laydown area, which would incorporate trenches to collect the filtrate and direct it to a filtrate holding tank, from where the filtrate would be pumped to the head of the plant.

This system also incorporates an odour control system which would draw air from the septage bar screen and holding tank when septage is being delivered, pumped into the Geotube, or mixed within the holding tank and treat the odourous air to prevent emission of fugitive odours.

The rate at which filtrate is pumped to the plant would need to be monitored to ensure that the characteristics of the raw sewage do not increase beyond the average range for domestic wastewater. Using the septage characteristics proposed is section 8.3, it is estimated that Geotube filtrate could be added to the plant at a maximum of 2.8% of the plant's instantaneous flow. At the Phase 1 average plant flow rate of 4,780 m<sup>3</sup>/d, the maximum filtrate addition translates to approximately 92 L/min.

The Geotube® technology was selected for this alternative because it has been successfully used at the Eganville WWTP in Eganville, ON for the past seven years and the supplier was able to provide data on the characteristics of the filtrate and the dewatered solids, which were needed to determine the level of treatment possible with this system and the maximum allowable rate of filtrate addition to the main plant.

Additionally, this alternative produces a biosolids end-product that can be land-applied as opposed to disposed of at a landfill, which is the typical disposal method for dewatered septage solids. This feature of this alternative is in keeping with the potential for resource recovery criterion used in the solids treatment train evaluation for Erin's WWTP. If instances occur where the characteristics of the Geotube solids do not permit them to be land applied, those solids can be disposed of at a landfill.

Advantages and disadvantage of this alternative are presented in Table 41.

#### Table 41 - Advantages and Disadvantages of Pre-Treatment with Geotubes®

| Advantages  | Disadvantages  |
|---|--|
| <ul> <li>Minimizes potential for plant upset</li> </ul>   | <ul> <li>Higher capital cost</li> </ul>                      |
| <ul> <li>Produces a biosolids product that can be<br/>disposed of by land application</li> </ul>                                | <ul> <li>Larger footprint than other alternatives</li> </ul> |
| <ul> <li>Low operator involvement</li> </ul>  |  |
| <ul> <li>Can accommodate fluctuations in septage<br/>characteristics</li> </ul>   |  |
| <ul> <li>Easily expanded to accommodate septage<br/>from neighbouring communities (revenue<br/>generation potential)</li> </ul> |  |

#### 7.6.4 Cost Comparison of Short Listed Septage Management Alternatives

Table 42 presents the life cycle costs associated with the septage management alternatives evaluated. Estimates have been rounded to the nearest thousand dollars. Details of the analysis can be found in Appendix F.

| Table 42 | - Cost E | Estimates of | of So | eptage | Manag | gement | Alternatives |
|----------|----------|--------------|-------|--------|-------|--------|--------------|
|----------|----------|--------------|-------|--------|-------|--------|--------------|

|  | Alternative 1<br>Direct Co-Treatment | Alternative 2<br>Design MBR to Treat<br>Septage | Alternative 3<br>Pre-Treat with<br>Geotube® |
|--|--------------------------------------|---|---|
| Capital Cost                             | \$498,000                            | \$504,000                                       | \$853,000                                   |
| Annual Operation and<br>Maintenance Cost | \$38,000                             | \$49,000  | \$243,000                                   |

#### COMMENTS

mponents and would be more visable than other alternatives.

c during construction as it has more components than the other

and has potential for odour impacts, although no odour issues have ations.

robust. Alternative 2 is more robust than Alternative 1 because the ate the increased loading. Alternative 3 is considered the most so not significantly affected by the septage characteristics or volume. ficantly weaker than raw septage, this option has much less

ount of land. Alternative 2 requires slightly more land. Alternative 3 he Geotubes<sup>®</sup>.

impacted if the main plant were unable to achieve its effluent oading by septage addition. Dewatering has very little chance of er alternatives have a high potential for plant upset.

less sustainable than Alternative 3 since the amount of septage imited and cannot be increased if needed and treatment capacity is racteristics.

e, however, Alterantive 3 would involve more construction due to the o greater climate change impacts.

est impact as it requires more land to be cleared for construction.

#### 7.6.6 Preliminary Preferred Alternative for Septage Management

Based on the results of the detailed evaluation of the septage management alternatives, pre-treatment with Geotube followed by co-treatment of the dewatering filtrate from the Geotubes is the preferred alternative.

# 8.0 Preliminary WWTP Preferred Design Concept

The results of the technologies alternative evaluation show that the MBR technology is the preferred alternative for the liquid train. The MBR technology can meet tertiary treatment requirements so a separate tertiary treatment process would not be required.

To prevent excessive membrane fouling during the operation of the MBR, an advanced primary treatment technology is needed to remove particles, including hair, that typically clog membrane filters. A rotary belt filter was coupled with the MBR alternative in this evaluation.

UV radiation was the preferred alternative for disinfection. A fine bubble aeration system that uses increased capacity from the MBR blowers was selected as the preferred alternative to elevate DO levels in the treated wastewater prior to discharge to the river.

On-site stabilization of sludge via an ATAD system, with land application of liquid biosolids was selected as the preferred alternative for Phase 1. It is recommended that the Town evaluate the potential for revenue generation through marketing of biosolids once Phase 1 is in operation and the nature and quantity of biosolids produced at the plant is known.

The wastewater treatment facility will incorporate a septage receiving and management/treatment system. The preferred alternative for septage management is dewatering by a dewatering membrane technology, such as GeoTubes® and treating the dewatering filtrate in the main plant.

Figure 10 shows the flow schematic of the preferred alternative for the liquid treatment train, including the septage receiving and treatment system.

Figure 10 – Preferred Liquid Treatment Train Process Flow Schematic

Figure 11 shows the preferred alternative for the sludge/biosolids treatment train.

Figure 11 – Preferred Solids Treatment Train Process Flow Schematic

## 8.1 WWTP Site Plan

Figure 12 presents a conceptual plant layout, which is based on the preliminary preferred treatment alternatives. The plant layout includes common facilities such as the administration building, standby power, odour control, and the effluent pumping station.

Figure 12 – Conceptual Site Layout of Preliminary Preferred Alternatives

# 8.2 Capital Costs of WWTP Construction

Based on the preliminary preferred alternatives, an estimate of the construction costs for the treatment plant was generated. The estimate incorporates factors such as equipment costs, tankage and building construction costs, site works, standby power, land acquisition, and engineering fees and permits.

A breakdown of the cost estimate is presented in Table 45.

#### Table 45 – Estimated Capital Construction of Erin WWTP

# 9.0 Conclusions and Recommendations

- The 2014 Servicing and Settlement Master Plan (SSMP) identified that a new wastewater collection system and treatment plant would be required to service the existing and expected growth population of Erin Village and Hillsburgh.
- The UCWS EA is a continuation of the Class EA process and includes establishment of the preferred treatment alternatives for the proposed new wastewater treatment plant.
- The updated Assimilative Capacity study completed for the UCWS Class EA study established the West Credit River as the receiving body for treated effluent from the wastewater treatment plant. The West Credit River is classified as a Policy 1 receiver.
- The updated ACS also established treatment effluent limits for pollutants that pose a threat to the river's ecosystem.
- It is proposed that construction of the wastewater treatment plant proceed in two phases. Phase 1
  would service the existing population with some allotment for future growth and Phase 2 (Full Buildout)
  would be an expansion of Phase 1 to service the total population growth for the Town.
- This UCWS Class EA study evaluated technology alternatives for the primary, secondary, tertiary, disinfection, and sludge treatment stages of the wastewater treatment plant.
- The ACS included a minimum limit for dissolved oxygen in the plant's treated effluent. Alternatives for re-oxygenating the treated effluent, following disinfection, were also evaluated.
- The WWTP is to include a septage receiving and management system, to accept and treat septage from residents who will be outside the recommended service area of the proposed new collection system. Septage management alternatives were included in this evaluation.
- Life-cycle cost analysis were performed for each treatment stage considered in the evaluation. Life cycle analysis included equipment costs, building and tankage construction costs, operating cost associated with energy and chemical consumption, and a net present value analysis.
- The preferred treatment technologies for the wastewater treatment plant are summarized below:

| Treatment Stage                  | Preferred Alternative  |
|----------------------------------|--|
| Primary Treatment                | Advanced Primary Treatment   |
| Primary Treatment                | (e.g. Rotary Belt Filter)  |
| Secondary and Tertiary Treatment | Membrane Bioreactor  |
| Disinfection                     | UV Radiation   |
|                                  | Fine Bubble Aeration   |
|                                  | (using up-sized secondary treatment blowers)   |
| Sludge Treatment / Management    | Sludge Stabilization via Autothermal Thermophilic Aerobic Digestion (ATAD) and Land Application of Stabilized Biosolids              |
| Septage Management               | Pre-Treatment with GeoTubes Followed by Co-Treatment at<br>the Main Plant and Land Application of Stabilized, Dewatered<br>Biosolids |

- It is recommended that the Town evaluate the potential for revenue generation through marketing of biosolids once Phase 1 is in operation and the nature and quantity of biosolids are known as well as market conditions at the time of production, as these factors are difficult to accurately assess at this time.
- Sensitivity analyses were performed on the detailed evaluation of each of the systems to assess how sensitive the results were to the weightings. For all but the septage management system, the evaluation results remained unchanged when the weightings were varied by 5% between pairs of criteria.
- For the septage management evaluation, a 5% increase in the environmental criterion with a 5% increase in the economic criterion results in the alternative of increasing the MBR capacity to directly co-treat septage without pre-treatment becoming the preferred septage alternative.
- The estimated total capital construction costs for Phase 1, including ancillary facilities, such as the administration building, siteworks, and yard piping, and standby power is \$43,052,500 (2017 dollars)
- The estimated total capital construction costs for Phase 2/Full Buildout is \$18,044,000 (2017 dollars)
- The estimated total cost for the wastewater treatment plant to Full Buildout is \$61,096,500 (2017 dollars).
- Based on a conceptual plant layout, the proposed sites for the WWTP would both be large enough to accommodate the preliminary preferred treatment alternatives.

## 1.0 System Overview

The recommended alternative wastewater system for Erin and Hillsburgh will consist of local and trunk sewers, sewage pumping stations and forcemains, a wastewater treatment plant and an outfall extending to the West Credit River. The wastewater system will extend from the North end of Hillsburgh through to south of Erin Village. As outlined in the Natural Environment Report, a considerable portion of the lands in Hillsburgh and Erin are environmentally sensitive. The West Credit River with tributaries and wetland areas also extend from the north end of Hillsburgh through Erin Village. The proposed infrastructure can experience malfunctions from time to time resulting in the potential for a wastewater spill to the river system.

The wastewater collection system will be completely separate from the stormwater system and will not be connected to roof down pipes or sump pumps. None the less, the flow capacity of the system will include an allowance for inflow and infiltration which is often the cause of spills. As the system ages, there will be opportunities for groundwater and storm water to enter the sanitary sewers. The sanitary sewage system, including pipes and sewage pumping stations, will also be designed for peak flows of 2.7 times the design capacity in accordance with Ministry of Environment and Climate Change (MOECC) design guidelines using the Harmon Peaking Factor. It is noted that all system pipes and pumping station wet wells will be sized and built for their ultimate capacity which will not be reached until full build out and this provides additional storage capacity in the sewer system over the short term. Critical unit processes in the wastewater treatment plant will also be designed for peak flows as per MOECC guidelines. While the plant will undergo a phased construction, each phase will be designed for peak flow. As such, it is unlikely that flows in the system will exceed the system capacity.

Due to the sensitivity of the local environment, overflow pipes from sewage pumping stations or overflow chambers that would permit by-passes or spills of untreated or partially treated wastewater to the natural environment throughout the system are not recommended. Ideally, all flows will be contained in the system until discharge of the treated effluent to the river. However, the trade-off with no overflow outlets to the environment and retaining sewage in the collection system is that the potential for flooding basements in areas serviced by pumping stations increases. This makes design and management of the system more important in order to ensure that sufficient system storage is provided for all flow scenarios.

The effluent disinfection system, in the recommended sewage treatment alternative evaluation, is UV which eliminates the risk of a spill to the river for chlorination and dechlorination chemicals.

## 2.0 Spills Risks

While the system will be designed to minimize the risk of overflows or spills to the natural environment, or back-ups into private properties, there does still exist some degree of risk. Overflows could potentially arise from:

- Main Breaks
- Main Blockages
- Capacity Exceedances from Infiltration and Inflow during storm events
- Equipment Failure

Town of Erin Wastewater Class EA Spills Risk Management

- Power Failure
- Control/Communications System failure
- Upgrade and expansion projects

## 2.1 Dealing with Potential Main Breaks

The highest risk of spills from wastewater pipe systems is from forcemain breaks as the pressure from pumps can result in spills to the surface similar to what is visible during watermain breaks. The recommended collection system alternative is based on using twin forcemains from sewage pumping stations except the smallest local stations. Leaks in manholes and sewers are more likely to allow groundwater into the system rather than causing a spill. Other measures to be considered in the design to minimize the risk of spills from main breaks include:

- Quality control during all aspects of construction including on development lands
- Use of heat welded polyethylene pipe for all forcemains
- Use of line valves for isolation of forcemain sections
- Use of pump pressure control to indicate leaks, send alarms and stop pump operation
- Implementing a preventative maintenance program including regular inspections using CCTV

### 2.2 Dealing with Potential for Main Blockages

Spills from wastewater pipe systems can also result from blockages of the sewer or pump intakes. This can be caused by illegal discharges of grease or large items. The recommended collection system alternative is based on using minimum sized sewers of 200 mm and non-clog sewage pumps. In addition, the entire system will be monitored using a computer control system that will alarm on pump failure or rising liquid levels in the pumping stations. Under normal conditions sewage collection systems operate continuously without blockages. Permitted discharges are defined within a sewer use by-law. Measures to be considered to minimize the risk of spills from blockages include:

- Implementation of a sewer use by-law that prevents discharge of materials likely to block the sewers or damage pumps
- Education leaflets on sewer use aimed at eliminating illegal discharges
- Regular inspections of industrial, commercial and school properties to prevent illegal discharges
- Careful hydraulic design of all elements to prevent sedimentation and deposits/build ups in the system
- Implementing a preventative maintenance program including regular inspections using closed circuit television (CCTV)

### 2.3 Dealing with Potential for Capacity Exceedances

Overflow events can occur when the volume of water entering the collection system exceeds the capacity of the sewers, pumping stations, or the treatment facility. In such events, the excess sewage can be by-passed through overflow discharges (typically to surface waters) or

collected within holding tanks. Without overflows or peak flow storage, excess sewage can also back-up within the collection system ultimately leading to basement flooding.

As noted above, the preferred alternative will be isolated from extraneous flows entering the system and consideration will be given to not allowing overflows out of the system. The system will be designed to contain flow events within collection system capacity, pumping station capacity and treatment capacity.

The potential for capacity exceedances will be greater as the collection system ages. The connection of roof downspouts, sump pump discharges, and stormwater catch basins to the sanitary system are common examples of past practices that have been discontinued and must be prevented. Deteriorated systems can experience flow peaks over 5 times the average flow. This must be prevented through maintenance and inspections. Newer systems and systems without the improper connections would exhibit peak flows as low as 2 times the average flow.

Fully eliminating all sources of system inflow and infiltration is not feasible; however, best practices can significantly reduce the scale of the issue. In a system without improper connections, extraneous flow will still enter the collection system through manhole covers, loose joints, or breaks caused by roots. The sewer use by-law, that is enforced, should address the issue of illegal connections.

Another source of extraneous flows in new collection systems is improper installation of sewer mains and laterals. In order to ensure new installations are completed correctly, testing of installed sewers should include flow monitoring before connections and CCTV inspections. Contractors should be required to repair all deficiencies identified through the monitoring program. Other inflow and infiltration minimizing measures, such as leak-free manhole lids in low-lying areas, should also be adopted.

Often, the installation of sewer laterals on private property can be a significant source of infiltration to the municipal collection system. It is recommended that the Town Building Department only allow the use of pipe materials that are typically specified for use on the municipal side of the collection system. Most municipalities require the use of DR 28 PVC pipe with gasketed joints.

As the system ages, the potential or risk of high flows exceeding the peak capacity of the wastewater treatment plant or pumping stations will increase. This can be managed by increasing storage throughout the system either by constructing additional wet wells at pumping station sites or storage tanks at critical locations such as the last pumping station before the wastewater treatment plant. The volume of storage necessary to manage peak flow events would need to be determined through focused risk assessments to determine the best location for the storage. In establishing sites for sewage pump stations and the treatment plant, provision should be made for the future construction of additional wet well capacity or storage tanks. Risk assessment would include risks associated with system back up and the potential for basement flooding. In the future, if the risk of basement flooding cannot be mitigated using increased storage or system capacity increases, it may be necessary to construct overflows from pumping stations to the river.

The suggested approach to establish the need for peak flow storage is as follows:

• Monitor daily wastewater flow averages and peaks at the treatment facility and track the scale and frequency of peak flow events

Town of Erin Wastewater Class EA Spills Risk Management

- Compare peak flow events to peak flow capacity in the collection system and treatment facility
- Quantify the risk (probability and consequence) of overflow events occurring
- Where the quantified risk is determined to be unacceptable:
  - o First:
    - Identify I/I sources through wastewater flow monitoring of the collection system
    - Enact inflow and infiltration reduction measures (pipe relining/ replacement, manhole rehabilitation, etc.)
    - Quantify the impact of inflow and infiltration reduction measures
  - $\circ$  Second:
    - Conduct risk analysis of overflow in each collection area
    - Establish peak flow retention within collection areas where risk exceeds acceptable levels

### 2.4 Dealing with Potential for Equipment or Pump Failure

Equipment or pump failure also have the potential to result in overflows or spills from wastewater systems. Pumps are a critical component in wastewater systems and are used to convey wastewater from pump stations to the treatment plant. A large number of pump systems also exist in treatment plants to operate many of the processes and finally to convey effluent to the river. Their failure can lead to a rapid build-up of wastewater with the potential for a spill. Likewise, the failure of chemical feed pumps, screens, air blowers, UV systems and other equipment in the treatment plant can result in process failures. The Ministry of Environment and Climate Change (MOECC) provides design guidelines for pumping stations and treatment plant design in Ontario that requires the use of dual or standby equipment for all pumping stations and treatment systems. The use of dual pumps and multiple treatment trains minimize the risk of pump or equipment failure resulting in a spill or discharge of partially treated wastewater. Measures that should be considered in the design and operation of the system to minimize the risk of spills from pump or equipment failure include:

- Installation of a minimum of dual systems for all pumps and equipment at sewage pumping stations and the treatment plant sufficient to ensure continuous operation of all systems
- Design for plant operational flexibility such that pump systems can have multiple duties
- Conduct a risk assessment and develop a contingency and response plan to deal with equipment failures
- Implement a Maintenance Management System (MMS) that prevents equipment failure
- Adopt a proactive approach to fixing any piece of equipment that is out of operation.
- Develop a contingency plan to by-pass pumping stations
- Maintain an inventory of critical spare parts on site

### 2.5 Dealing with Potential for Power Failure

Wastewater systems must have a continuous and reliable supply of power for the safe operation of the system. The preferred treatment plant alternative has a wide range of equipment, instruments and control devices that require continuous and stable power. Treatment plants and

Town of Erin Wastewater Class EA Spills Risk Management

pumping stations are built in strict compliance with electrical codes that ensure all electrical systems are safe and reliable. Measures that should be considered in the design and operation of the system to minimize the risk of spills from power failure include:

- Negotiate multiple power feeds to sewage pumping stations and treatment plant with the power authority
- Consider using twin power transformers to ensure a more robust supply
- Install standby power with automatic transfer from the prime power source sufficient to maintain the entire facility in operation during prime power failure
- Select a fuel supply for standby power based on the security of the supply (gas or diesel)
- Protect all electrical systems against the threat of lightning strikes

### 2.6 Dealing with Potential for Control/Communication Failure

Continuous operation of the wastewater system will rely on the System Control and Data Acquisition (SCADA) System. This is the system that will automatically control the operation of all equipment throughout the system 24 hours a day. It automatically starts and stops equipment as necessary and provides alarms to the operators in the event of any failure. Typically, operators can remotely investigate any issues with the operation and either remotely start a standby system, or go to the facility and take manual control of the particular system. The control system consists of sensing instruments, controllers and computers using control software customized for the particular system operation.

A system wide communications system that allows all facilities to be interconnected to the control system must also be robust and secure to support system reliability.

SCADA systems improve the reliability of the operation and greatly reduce the response time needed to deal with operational issues. Measures that should be considered in the design and operation of the system to minimize the risk of spills resulting from a control/communications system failure include:

- Design the SCADA system with dual controllers and computers
- Ensure protection and back up of all sensitive controls and computer networks using Uninterruptible Power Supply (UPS)
- Develop a contingency plan for manual operation in the event of control system failure
- Regularly maintain all sensing instruments

### 2.7 Upgrade and Expansion Projects

Upgrade and expansion projects can often be a source of planned bypasses if systems require to be taken out of operation to facilitate installation of new or replacement equipment. Measures that should be considered in the design to eliminate the need for bypassing during construction include:

- Conceptually design full build-out of the plant during the first phase and develop a constructability plan for all phases that eliminates the need to remove units from operation during future construction phases.
- Ensure sufficient isolation valves are constructed in the first phase.
- Provide for connection to future expansions during Phase 1.
- Provide for the replacement of all equipment while maintaining system capacity.

## 1.0 Wastewater System Overview

The recommended alternative wastewater system for Erin Village and Hillsburgh will consist of local and trunk sewers, sewage pumping stations and forcemains, a wastewater treatment plant and an outfall extending to the West Credit River. The wastewater system will extend from the North end of Hillsburgh through to south of Erin Village. As outlined in the Natural Environment Report, a considerable portion of the lands in Hillsburgh and Erin Village are environmentally sensitive. The West Credit River with tributaries and wetland areas also extend from the north end of Hillsburgh through Erin Village. Pipelines will mostly be on existing rights of way as well as the Elora Cataract Trail. Sewage Pumping Stations will be on public and private lands with several close to sensitive environmental features. The Wastewater Treatment Plant will be located in open lands with several sensitive features. The project is likely to generate a wide range of construction activities throughout a sensitive environmental landscape and could potentially impact surface waters, groundwater, trees within woodlots and along existing streets as well as wildlife, vegetation and fish.

To support the Class Environmental Assessment process, a Natural Environment Assessment and Geotechnical study were undertaken for the project area primarily to assist with establishment and evaluation of alternative solutions.

To support construction, a more detailed assessment will be required on each facility site and along all of the streets and routes for pipelines. This more detailed assessment will delineate all potential environmental impacts and will outline necessary mitigations to eliminate negative impacts.

It is recommended that all of the necessary studies be undertaken at an early stage in the design of the wastewater system to ensure that potential impacts are taken into consideration in the siting and timing of the works so as to avoid conflicts with natural environment hazards during construction.

This Technical Memorandum sets out to define the scope of an Environmental Management Plan that captures all of the necessary studies and mitigations necessary to support construction. The scope was developed based on work undertaken for previous similar projects as well as comments received from statutory authorities during the Class EA process. When completed, the Environmental Management Plan will provide guidance to designers and contractors to minimize potential impacts to the environment.

During construction of the works, it is recommended that, in addition to construction inspectors on site, all construction work be monitored by an environmental inspector responsible for making sure that works are carried out in accordance with the Environmental Management Plan.

It is anticipated that the Environmental Management Plan will be submitted in support of permits required by Credit Valley Conservation. The scope of an Environmental Management Plan will be developed and agreed with CVC and any other relevant agencies prior to commencement of project implementation.

## 2.0 Suggested Scope of Environmental Management Plan (EMP)

The following outlines a suggested scope for the EMP:

### 2.1 Regulatory Approvals, Authorization and Permits

The project will have to comply with all relevant environmental legislation, regulations, permits, approvals and exemptions at a federal, provincial and municipal level. The EMP should identify all of the anticipated permits, approvals and exemptions relevant to this project. Approvals include:

#### Federal Regulatory Approvals

Federal Regulatory approvals include but are not limited to the following:

- Fisheries Act
- Migratory Birds Convention Act
- Species at risk Act

#### **Provincial Regulatory Approvals**

Provincial Regulatory approvals include but are not limited to the following:

- Conservation Authorities Act
- Endangered Species Act
- Municipal Act
- Trees Act

### 2.2 **Project Implementation**

#### Timing

The EMP should identify the anticipated timeline, from tendering and contract reward to the various phases of construction. Regulatory requirements should be considered when establishing a timeline. All timing restraints so to minimize the impact on the environment as well as the community should all be identified and built in to construction contracts.

#### **Construction Impacts**

All necessary studies including geotechnical, hydrogeological and environmental will need to be carried out as necessary to identify construction methods necessary to mitigate any potential impacts on the natural environment. The following will need to be determined through necessary studies and assessments.

#### **Extent of Disturbance**

Ground composition for all excavated areas so as to identify any potential contamination, soil
conditions and groundwater conditions sufficient to develop construction methods that mitigate
any impacts.

#### Erosion and Sediment Controls.

- Construction methodologies that require erosion and sediment control and their timing.
- Location of erosion and sediment control.
- Erosion and sediment control plan approvals.
- Inspection requirements

#### Dewatering

• Hydrological assessments to determine the locations of ground water control.

Town of Erin Wastewater Class EA Scope of Environmental Management Plan

- Analysis of local surface water to determine quality.
- Construction methods that require dewatering and the timeline thereof.
- Zone of influence the lateral extent of ground water drawdown and its severity.
- Inspection requirements.
- Dewatering parameters such as:
  - Steady state ground water inflow rate.
  - Excess inflow rate from groundwater storage and precipitation.
  - Total pumping rate allowance.
  - MOECC permit to take water requirements.
  - Discharge location and monitoring.
    - Requirements for discharge into a storm sewer.
    - Requirements for discharge into a creek.
    - On site discharge treatment facilities.
    - Analysis of water chemistry parameters: Cobalt, Aluminum, iron and TSS.
    - Frequency of monitoring.
    - Monitoring equipment.
    - Turbidity of discharge.
    - Contingency plan if discharge does not meet requirements.
    - Restoration of treatment facilities.

#### Soil Management

- Storage and reuse of any disturbed soils.
- Development of a soil management plan.

### 2.3 Natural Heritage Existing Conditions Information

A detailed Natural Heritage assessment of existing conditions of all areas that may be affected by construction should be carried out as follows:

#### Vegetation and Vegetation Communities

Identify features that would be considered candidate Life Science Area of Natural and Scientific Interest (LS-ANSI), Provincially Significant Wetlands (PSW) or other provincially significant features.

The methodology used for determining geographical extent, composition, structure and function of all vegetation communities should be described as well as methods and software used for conducting a tree inventory. The significance of the timing of the survey should also be defined.

The vegetation and vegetation communities will need to be classified within the study area. The following information is gathered:

- Zoning and associated semi-natural/natural vegetation.
- Topography and the corresponding wetlands and uplands.
- LS-ANSI, PSW and other areas of significance.
- Plant species and forest types.
- Previously disturbed areas and the effect the disturbance had on the vegetation.

Information collected in the tree inventory is to be compiled into an arborist report. Details of the arborist report include:

Town of Erin Wastewater Class EA Scope of Environmental Management Plan

- Information collected in tree inventory such as, total number of trees, species identification, breast height, diameter at breast height, tree condition, canopy structure, crown vigour and other general comments.
- Location and ownership of the trees
- Significance of the timeline of tree capture
- Location of large trees
- Location of smaller trees
- Trees regulated under the Endangered Species Act.

Significant areas to be impacted by construction should be recognized and opportunities to avoid or minimize vegetation removal in these areas should be discussed. Disturbance limits, protection measures and restoration requirements should also be established in consultation with the relevant agencies.

#### Fish and Fish Habitat

Fish habitat communities within the study area have previously been identified. The EMP will focus on the potential for disturbance during any in water work including any pipe crossings or construction of the effluent outfall structure.

Surveys should be conducted at the sites of any potential impacts on fish and fish habitat including areas for discharge from dewatering activities as well as in water work and the following defined:

- Identify species that could be affected
- Define potential impacts from construction activities
- Suggest mitigations and timing limitations for construction activities

#### Wildlife and Wildlife Habitat

Wildlife habitat communities within the area of any construction activities will need to be fully defined as follows:

- List significance wildlife species
- Define potential impacts from construction activities
- Suggest mitigations and timing limitations for construction activities

### 2.4 Environmental Protection and Mitigation Plan

Describe the environmental protection measures that will be implemented during construction to avoid or mitigate adverse environmental effects and identify entities responsible for the implementation. For each of the following, identity any adverse activity; the anticipated effect of that activity; environmental protection and mitigation measures to compensate for the adverse effects of that activity; and the relevant regulatory requirements concerning the activity.

- Vegetation and Vegetation Communities
- Fish and Fish Habitat
- Wildlife and Wildlife Habitat
- Designated Natural Areas

#### 2.5 Regulatory Approvals, Authorizations and Permits

The EMP will present in tabular format, the permits approvals and exemptions required for the project.

Town of Erin Wastewater Class EA Scope of Environmental Management Plan

### 2.6 Environmental Inspection/Monitoring Measures

The EMP will describe the environmental inspection and monitoring measures to be implemented preconstruction, during construction and post-construction. The following should be defined:

- Powers and Functions of the Environmental Inspector
- Reporting Requirements
- Type, Elements and Frequency of Environmental Inspection/Monitoring

### 2.7 **Contingency and Emergency Response Measures**

The EMP will describe the measures that the contractor and owner will be required to follow during construction operation and maintenance in response to emergencies and unforeseen events. Contingency measures should be provided for events such as but not limited to:

- Fuel and Hazardous Material Spills Response
- Failure of Erosion and Sedimentation Control Measures
- Tunneling failure
- Encounters with species at risk
- Spills response during commissioning and operation of the wastewater system

Appendix - U Opinion of Costs

File No. 115157

Triton Engineering Services Limited 105 Queen Street West Unit 14 Fergus, ON N1M 1S6

Attn: Christine Furlong, P.Eng. Project Manager

Ref: Town of Erin, Urban Centre Wastewater Servicing Class EA Erin Wastewater Capital Cost Summary Report

Dear Ms. Furlong:

We are pleased to present our Report outlining "Wastewater System Capital Costs" for the Urban Centre Wastewater Servicing Schedule 'C' Municipal Class Environmental Assessment (EA).

This Report provides an outline of the capital cost estimates for the preferred alternative sanitary system components. The estimated capital cost for all system aspects are presented along with discussion of potential cost sharing opportunities. The cost estimates for servicing the existing community and the potential full buildout community are presented for comparison.

Should you have any questions or require clarifications, please contact the undersigned.

Yours truly,

AINLEY & ASSOCIATES LIMITED

## **Executive Summary**

- The Urban Centre Wastewater Servicing Class EA (UCWS EA) identified the opportunity to service a higher population than assumed in the Servicing & Settlement Master Plan (SSMP), an increase from a service residential population of 6,000 to 14,559.
- Costing has been completed on the basis of servicing to this higher population level.
- Connected properties will have to pay for 3 separate cost components:
  - Municipal System Capital Cost
    - Identifies the cost to construct the entire wastewater system up to the street line/property line outside each property.
    - Financed by the Town and paid for by all connected properties.
    - Payment options will be offered by the Town including upfront payment or loans over a number of years.
    - Eligible for a government grant.
  - Private Property Connection Cost
    - The cost to connect the system from the street into each property.
    - Paid for directly by the property owner at time of connection.
    - Not eligible for a government grant.
  - System Operating Cost
    - Paid for through monthly billing to serviced properties through user rates similar to water rates.
- This capital cost report addresses the Municipal System Capital Cost and the Private Property Connection Cost which together account for the full cost to build the wastewater collection and treatment system and connect all of the properties.

#### Municipal System Capital Cost

- System Capital Costs presented herein were all developed in a series of independent memoranda covering each aspect of the system including:
  - Collection system,
  - Wastewater treatment plant (WWTP), and
  - Treated effluent outfall.
- System Capital Costs presented herein were developed on the basis of servicing the existing community including infill and intensification as well as all new growth potential.
- The updated System Capital Cost estimate is based on the more accurate design solution from the UCWS EA including:
  - A refined service area.
  - A comprehensive collection system design solution.
  - A treatment plant design solution capable of meeting stringent effluent requirements for discharge to the West Credit River.
  - Selected outfall location.

- The System Capital Cost of constructing a system for the larger service population including all of the designated development lands shown in the Town's Official Plan is approximately \$118.2 million.
- A summary of the System Capital Costs for each system component for the full build-out scenario is provided in Table E1.

| System Component  | Estimated Cost<br>(2017 CAD\$) |
|-------------------|--------------------------------|
| Collection System | \$<br>55,211,000               |
| Treatment System  | \$<br>61,381,500               |
| Outfall           | \$<br>1,606,760                |
| Total             | \$<br>118,199,260              |

#### Table E1 – System Capital Cost

- The share of system capital cost between existing residents and new development is an important consideration.
- In order to identify the system capital cost sharing between the existing communities and new developments an Official Plan (OP) review process will need to be completed and system capacity will need to be allocated based on the OP objectives.
- For all aspects of the system shared between the existing community and development, it is recommended that system capital cost sharing is based on capacity/flow proportioning between the existing communities and developers.
- It is recognised that system capital cost sharing will also depend on project financing and implementation.
- Based on a review of the preferred alternative identified in this Class EA study, it is likely that the Town share of the system capital cost will be between \$50 million and \$60 million, representing 40% to 50% of the total cost.
- This will leave the balance of the \$118.2 million between \$58 million and \$68 million to be paid by developers representing 50% to 58% of the total cost.
- The Town's share of the larger system will be less than if a smaller system was built by the Town to service the existing areas with only modest growth.
- The Town's share of the cost may depend on:
  - The extent sharing necessary for the collection system to service all the planned growth areas.
  - Whether the first phase is primarily to support the existing community.
  - Whether the first phase is primarily aimed at servicing new developments.
- The actual capital cost share between the Town and developers can only be established after allocation of capacity across the system and when planning approvals and financing is in place.
- The capital cost will be shared between each property in the existing communities plus any infill or additional units added within the communities which could be up to a total of 2,670 lots.

- Although the Town's share of the cost would be between \$50 and \$60 million, the Town has no means to finance this amount. In fact, the Town can only finance approximately \$15 to \$18 million. The balance of the funding will have to come from government grants or other funding sources.
- The project cannot proceed without government grants
- Based on a Town net cost of \$18 million and anticipating servicing 2672 lots in the existing communities including infill and intensification, this means that the average municipal capital cost component for each property would be \$7,500.
- Based on this, the Town could finance between 33% and 40% of their \$50 to \$60 million share of the project cost, with the balance of between 60% and 67% of the cost coming from a government grant or other funding sources.
- Typically government grants only pay for infrastructure that service the existing community. Infrastructure required for growth is paid for by benefitting new development.

#### Private Property Connection Cost

- In addition to the system capital costs defined above, each property will need to connect to the system.
  - Costs to connect each private property to the municipal system at the property line will be the responsibility of the property owners.
  - A range of connection costs were developed for both the piping and landscaping required for connecting private properties to the system and make the existing septic tank safe.
    - Piping costs range from \$3,200 \$14,700, with the typical lot paying \$4,500.
    - Landscaping costs range from \$600 \$5,500, with the typical lot paying \$1,500.
    - On average most properties can expect to pay between \$4,000 and \$8,000 with the average cost being approximately \$6,000 to connect to the system.

#### **Overall Capital Cost for Connected Properties**

- Connected properties will have to pay their share of the Municipal System Capital Cost which will be approximately \$7,500 on average with industrial/commercial properties paying more than this depending on their wastewater flow.
- Connected properties will have to pay their own Private Property Connection Cost to connect to the sewer in the street with most properties costing between \$4,000 and \$8,000.
- So each property would have to pay for the \$7,500 system construction cost and \$4,000 to \$8,000 connection cost. A total of \$11,500 to \$15,500.

## **1.0 Introduction**

This Technical Memorandum has been prepared as a summary report for the capital cost estimates for all components of the Wastewater System recommended preferred alternative. The information provided is in support of the Town of Erin Urban Centre Wastewater Servicing Environmental Assessment (UCWS EA).

Properties within Erin Village and Hillsburgh are currently serviced by individual private septic systems. The Servicing and Settlement Master Plan (SSMP), completed by B.M. Ross in 2014, selected a municipal wastewater collection system for both communities as the preferred general alternative solution to deal with issues related to the private systems and growth. The SSMP completed part of Phase 1 and part of Phase 2 of the Class Environmental Assessment process and the Town is now engaged in completing these two phases and moving on to complete Phase 3 and Phase 4 of the Class EA process.

The UCWS EA has identified the opportunity to service a higher population than was assumed in the SSMP and the costing has been completed on the basis of servicing to this higher population level. The estimated capital costs presented herein were all developed in a series of independent memoranda covering each aspect of the system, i.e. the collection system, wastewater treatment facility, and treated effluent outfall. Costs presented were developed on the basis of servicing the existing community including infill and intensification as well as all new growth potential.

## 2.0 Objectives

The objectives of this report are as follows:

- Provide a clear outline of the estimated capital costs for all system components
- Compare the capital costs of establishing a system for the existing community and for the full build out
- Define the cost sharing opportunities between the existing community and development

## 3.0 Capital Cost Overview

Within the SSMP, a capital cost estimate was generated based on 2014 prices, to service the existing communities with a small allowance for growth to service an equivalent population of 6,000 persons. The capital cost estimate identified in the SSMP was \$58.0 million. Inflating this to 2017 prices would give a present day cost of \$63.4 million.

The UCWS EA has identified the opportunity to expand the residential population to 14,599. The UCWS EA also refined the service area, completed development of a more comprehensive collection system design solution and also identified a treatment plant design solution to meet the stringent effluent requirements needed to meet the MOECC effluent limits for discharge to the West Credit River as well as selecting an outfall location. The capital cost to service this

larger population is therefore based on a more accurate design solution than was used in the SSMP.

In order to compare the capital cost of servicing the existing communities based on the more accurate design solution from the UCWS EA with the SSMP cost, the team has identified an updated cost to service the existing communities alone using the latest design solution while also allowing for infill and intensification within the existing built boundary. The updated cost, determined through the UCWS EA, to service the existing communities would be \$72.4 million which would need to be paid for by the existing property owners including infill and intensification.

The capital cost of constructing a system for a larger service population including all of the designated development lands shown in the Town's Official Plan would be substantially higher at \$118,200,000. These capital cost scenarios are summarised in Table 1. All project costs include both engineering and construction costs as well as a 15% contingency.

## Table 1- Capital Cost Comparison

| Cost Scenario                                       | Estimated Capital<br>Cost (\$2017) |
|---|------------------------------------|
| SSMP – Existing Communities Only                    | 63,400,000*                        |
| UCWS EA – Existing Communities Only                 | 72,400,000                         |
| UCWS EA – Full Build-Out Including new Developments | 118,200,000                        |

\*Inflated to \$2017 at 3%/year

The local sewers needed within each new development area are not included in the above full build out costs, as these costs are 100% the responsibility of the developers. It is important to note that there is a considerable scale effect from constructing the larger system with the cost per unit reducing with an increased service population.

# 4.0 UCWS EA Full Build-Out Capital Cost

Capital cost estimates have been developed for each component of the wastewater system. The following sections summarise the capital cost estimates for the collection system, treatment system, and outfall. A summary of the capital costs for each system component is provided in Table 2.

| System Component  | Estimated Cost<br>(2017 CAD\$) |             |  |
|-------------------|--------------------------------|-------------|--|
| Collection System | \$                             | 55,211,000  |  |
| Treatment System  | \$                             | 61,381,500  |  |
| Outfall           | \$                             | 1,606,760   |  |
| Total             | \$                             | 118,199,260 |  |

#### Table 2 – Full Build-Out System, Capital Cost Summary

# 4.1 Collection System Capital Cost

The estimated capital costs for the proposed blended gravity/ low pressure sewer system are outlined in Table 3. The capital costs presented in Table 3 are based on servicing the full build out population.

| System                         | Estimated Cost<br>(2017 CAD\$) |            |
|--------------------------------|--------------------------------|------------|
| Trunk and Local Gravity Sewers | \$                             | 23,072,000 |
| Pressure Sewers                | \$                             | 1,008,000  |
| Manhole Installation           | \$                             | 2,884,000  |
| Grinder Pump Stations          | \$                             | 504,000    |
| Sewage Pumping Stations        | \$                             | 16,534,000 |
| Forcemains                     | \$                             | 9,429,000  |
| Approvals                      | \$                             | 500,000    |
| Portable Generator             | \$                             | 150,000    |
| Land Acquisition               | \$                             | 500,000    |
| Utility Relocations            | \$                             | 630,000    |
| Total Capital Cost             | \$                             | 55,211,000 |

# Table 3 – Blended System Capital Cost Summary

The collection system costs identified in this section include all costs for sewers in the streets up to the lot line at each property. They do not include the connection costs on private property to connect to the existing sewage pipe that currently outlets to the septic tank. This connection cost estimate is outlined in section 6 below.

No phasing of the collection system has been identified as there are many implementation scenarios depending on which areas are serviced first.

# 4.2 Wastewater Treatment Plant Capital Cost

Based on the recommended preferred alternative, an estimate of the construction costs for the treatment plant was generated. The estimate incorporates factors such as equipment costs, tankage and building construction costs, site works, standby power, land acquisition, engineering fees and permits.

The capital cost estimates are presented in Table 4 based on servicing the full build out population.

| Component                              | Full Buildout Capital Co<br>Estimate<br>(2017 Dollars) |            |
|--|--|------------|
| Preliminary Treatment/ Headworks       | \$   | 3,312,000  |
| Primary/ Secondary /Tertiary Treatment | \$   | 24,786,480 |
| UV Disinfection                        | \$   | 759,000    |
| Effluent Pumping                       | \$   | 2,700,000  |

Table 4 – Estimated Capital Construction of Erin WWTP

| Component                                | Full Buildout Capital Cost<br>Estimate<br>(2017 Dollars) |            |  |
|--|--|------------|--|
| Effluent Re-Oxygenation                  | \$   | 100,000    |  |
| Biosolids Treatment                      | \$   | 13,718,000 |  |
| Septage Management                       | \$   | 1,315,000  |  |
| Odour Control                            | \$   | 3,499,000  |  |
| Standby Power                            | \$   | 1,800,000  |  |
| Administration and Maintenance Buildings | \$   | 960,000    |  |
| Site Works                               | \$   | 7,647,020  |  |
| Land Acquisition                         | \$   | 785,000    |  |
| Total Capital Costs:                     | \$   | 61,381,500 |  |

# 4.3 Outfall Capital Cost

The preferred outfall location is at Winston Churchill Boulevard. The capital cost estimate includes the cost of the pie and appurtenances to convey the effluent from outside the treatment plant site to the West Credit River at Winston Churchill Boulevard. The cost for effluent pumping equipment and pipe on the WWTP site is included in the treatment plant cost.

The cost estimate breakdown is provided in Table 5.

| Table 5 – Outfall Capital Cost Estimate, Full Buildout Scenario |                      |           |        |    |           |  |
|---|----------------------|-----------|--------|----|-----------|--|
| Alternative 2 (Twin 300mm Forcemains + 300mm Gravity Sewer)     |                      |           |        |    |           |  |
|   | Units Unit Cost Cost |           |        |    |           |  |
| Twin 300mm Forcemain  | 1696 m               | \$        | 800    | \$ | 1,356,800 |  |
| 300mm Gravity Sewer   | 323 m                | \$        | 520    | \$ | 167,960   |  |
| Manholes  | 4                    | \$        | 10,000 | \$ | 40,000    |  |
| Air Chambers  | 1                    | \$        | 12,000 | \$ | 12,000    |  |
| Outfall Structure   | 1                    | \$ 30,000 |        | \$ | 30,000    |  |
| Total \$ 1,606,760  |                      |           |        |    |           |  |

#### **Capital Cost Sharing Opportunities** 5.0

The summary of costs presented in Table 2 provides an outline of the capital cost to service the existing community as well as costs associated with constructing the system to allow for new development including oversizing gravity sewers and pumping stations to allow for increased flow from the development areas.

In order to identify the cost sharing between the existing communities and new developments, it will be necessary to:

Complete the Official Plan (OP) Review process including allocation of required growth • from Wellington County

- Based on the updated OP, allocate capacity to the existing community and to infill and intensification in accordance with the OP objectives
- Based on the updated OP, allocate capacity to each development area in accordance with the OP objectives for residential density, commercial, industrial and institutional developments
- After completing allocation of sewage capacity in accordance with the OP objectives, revise the collection system design to meet the flow capacity requirements of all areas.

It is recommended that, cost sharing will be based on:

- Allocation of collection system costs based on capacity/flow proportioning between the existing communities and developers for all trunk sewers, pumping stations and forcemains
- Allocation of treatment plant costs based on capacity/flow proportioning between the existing communities and developers
- Allocation of outfall costs based on capacity/flow proportioning between the existing communities and developers

It is recognised that cost sharing will also depend on project financing and implementation.

Implementation planning will depend on:

- Financing limits of the Town and the ability to secure funding from the Province and the Federal Government
- Varying schedules and approvals for all of the developers

Implementation scenarios might include:

- 1. A first phase primarily driven by the Town if funding is in place prior to the developments being approved. In this case, the Town costs may be slightly higher as the developers may not be in a position to finance a share of the initial phase.
- 2. A first phase wherein both the Town (with upper government funding in place) and developers are able to jointly fund the first phase with the developers being in a better position to cost share and to provide front end financing. In this case, the Town share would likely be reduced.
- 3. A first phase wherein the developers are the prime drivers and would finance and front end the development of the trunk sewer system and treatment plant. In this case the Town share maybe further reduced compared to scenario 2 above.

Based on a review of the preferred alternative identified in this Class EA study, it is likely that the Town share will be approximately \$60 million if the first phase is primarily to support the existing community and approximately \$50 million if the first phase is primarily aimed at servicing new developments.

The actual cost share can only be established after allocation of capacity across the system and when planning approvals and financing are in place.

Although the Town's share of the cost would be between \$50 and \$60 million, the Town has no means to finance this amount. In fact, the Town can only finance approximately \$15 to \$18 million. The balance of the funding will have to come from government grants or other funding sources. Based on a Town net cost of \$18 million and anticipating servicing 2672 lots in the existing communities including infill and intensification, this means that the average capital cost for each property would be \$7,500 for the construction on public streets.

Based on this, the Town could finance between 33% and 40% of their \$50 to \$60 million share of the project cost, with the balance of between 60% and 67% of the cost coming from a government grant or other funding sources.

# 6.0 Connection Costs on Private Property

The total system cost will include the municipal capital cost, identified in section 4 above, to the lot line of each property. Costs to connect from the municipal property line to the building on each private property will be the responsibility of the property owners and these costs have been estimated by the project team based on a survey existing properties in the community.

In order to develop an accurate assessment of connection costs throughout Erin Village and Hillsburgh, a street-by-street survey was conducted to assess the level of difficulty to connect homes to a collection system. Constructability aspects considered included the amount of landscaping which would be required to connect, the distance from the existing septic system to the street, tree and shrub removals/ replacement, and any driveway, curb and/or sidewalk repairs which would be necessary.

Each property was assessed for connection difficulty and rated on a five point scale for piping cost and for landscaping cost with 5 being the most difficult construction rating. The connection difficulty ratings for landscaping and piping are independent and are not inherently linked. For example, a property could receive a landscaping rating of 5 with a plumbing rating of 1.

The costs associated with each piping rating are summarized in Table 6. For the piping ratings a capital cost for both "gravity based systems" and "pressure based systems" are provided.

| Piping Rating   | Unit                       | Grav<br>Sys | vity Based<br>stem Cost | Sy | Pressure<br>/stem Cost |
|---|----------------------------|-------------|-------------------------|----|------------------------|
| 1 – Simple Connection   | 15-20m of sanitary lateral | \$          | 3,700                   | \$ | 3,200                  |
| 2 – Through Driveway  | 15-20m of sanitary lateral | \$          | 4,200                   | \$ | 3,600                  |
| 3 – Long Distance   | 21-30m of sanitary lateral | \$          | 4,700                   | \$ | 4,000                  |
| 4 – Long Distance, Through Driveway   | 21-30m of sanitary lateral | \$          | 5,100                   | \$ | 3,400                  |
| 5 – Difficult connection requiring internal<br>plumbing or large commercial<br>connection | 15-20m of sanitary lateral | \$          | 14,700                  | \$ | 5,000                  |

## Table 6 – Service Connection Costing for Piping

The frequencies of the connection ratings assigned to the existing community are displayed in Figure 1.

# Connection Ratings - Frequency Histogram

# Figure 1 – Connection Rating Histogram

The costs associated with each landscaping rating are summarized in Table 7.

## Table 7 – Service Connection Costing for Landscaping

| Landscaping Rating             | Unit   | Gravity B<br>System | ased<br>Cost |
|--------------------------------|--|---------------------|--------------|
| 1 – Minor Grass Replacement    | 30 m <sup>2</sup> – Sod and Topsoil                                      | \$                  | 600          |
| 2 – Major Grass Replacement    | 60 m <sup>2</sup> – Sod and Topsoil                                      | \$                  | 1,000        |
| 3 – Shrub/Garden Impacts       | 30 m <sup>2</sup> – Sod and Topsoil Shrub/Hedge<br>Replacement           | \$                  | 1,300        |
| 4 – Single Tree Replacement    | 30 m <sup>2</sup> – Sod and Topsoil<br>Tree Removal/Replacement          | \$                  | 3,000        |
| 5 – Multiple Tree Replacements | 30 m <sup>2</sup> – Sod and Topsoil<br>Multiple Tree Removal/Replacement | \$                  | 5,500        |

The frequencies of the landscaping ratings assigned to the existing community are displayed in Figure 2.

| Re:   | Financial Assessment of Town of Erin Urban Centre Wastewater<br>Class EA | e-mail  |  |

# 1. Study Purpose

In 2014, the Town of Erin completed a Servicing and Settlement Master Plan (SSMP) to address servicing, planning, and environmental issues within the Town. The study area for the SSMP included Erin Village and Hillsburgh as well as a portion of the surrounding rural lands. The SSMP considered servicing and planning alternatives for wastewater and identified a preferred wastewater servicing strategy for existing and future development in the study area. The SSMP was conducted in accordance with the requirements of the Municipal Class Environmental Assessment (Class EA), which is an approved process under Ontario's Environmental Assessment Act. The SSMP addressed Phase 1 & components of Phase 2 of the Class EA planning process.

Through the Urban Centre Wastewater Servicing Class EA (UCWS Class EA) the Town is now continuing with a review of Phase 2 and completing Phases 3 & 4 of the Class EA Planning Process to determine the preferred design alternative for wastewater collection for the existing urban areas of Erin Village and Hillsburgh, and to accommodate future growth. The Town has retained Ainley Consulting Engineers to undertake this work.

The aforementioned SSMP concluded that the preferred solution for both communities is a municipal wastewater collection system conveying sewage to a single wastewater treatment plant located south east of Erin Village with treated effluent being discharged to the West Credit River. In total, the treatment plant would service a population of 6,000. In completing Phase 2 activities within the UCWS Class EA, the preferred solution, remains as established

under the SSMP, however, the serviced population has been increased to 14,559 persons to account for growth in accordance with the Town's Official Plan (OP).

The UCWS Class EA outlines a wastewater servicing plan for a population of 14,559, sufficient to service both existing communities and full buildout growth to meet the development potential of future development lands identified in the present OP. The present community has 1,800 residential/commercial/industrial units along with the potential to provide for 872 infill/intensification units (a total of 2,672 equivalent units).

As part of the SSMP process, Watson & Associates Economists Ltd. were retained to undertake a financial evaluation of the servicing plan. Watson has been retained again to consider the following matters related to the servicing of these communities with a draft wastewater solution, as follows:

- The method and impact of financing for the servicing costs and the implications on the Town's finances
- A breakdown of the costs by growth capital costs to be funded by developers, existing resident costs to be funded by properties receiving the wastewater servicing, and property connection costs
- Identify the potential cost impact on households and businesses
- Identification of capital financing methods available to the Town based upon the nature of the costs, past policies of the municipality, and the perspective of Council
- Municipal debt load capacity limits and potential grant funding needs

# 2. Summary of Capital Costs

The study team have undertaken a number of Public Information Centres regarding the servicing solution for the Erin and Hillsburgh communities. At the February 2, 2018 meeting, the design alternatives and draft servicing approach were presented. In support of Ainley's draft recommendations, the following reports have been prepared and were presented for public review and comment:

- 1. Natural Environment Report
- 2. Outfall Alternatives Technical Memorandum
  - Selects preferred site for discharge to West Credit River
- 3. Wastewater Treatment Plant (WWTP) Site Selection Technical Memorandum
  - Selects preferred site for WWTP
- 4. Collection System Alternatives Technical Memorandum

- Identifies preferred Collection System
- 5. Pump Stations and Forcemains Routing Alternatives Technical Memorandum
  - Identifies preferred Forcemain routing between Hillsburgh and Erin
- 6. Wastewater Treatment Technology Evaluation Technical Memorandum
  - Identifies preferred treatment system
- 7. Other Reports including Cultural Heritage Assessment Report, Stage 1 Archeological Assessment Report & Geotechnical/ Hydrogeological Report

The draft servicing plan provides for an identified capital costs of \$118 million (2017\$) to service both the existing and future properties (14,559 residential population), as follows:

| System Component   | Capital Cost (2017\$ rounded) |
|--------------------|-------------------------------|
| Collection System  | \$55,211,000                  |
| Treatment System   | \$61,381,500                  |
| Outfall            | \$1,607,760                   |
| Total System Costs | \$118,119,260                 |

The above costs provide for servicing to the property line of existing homes and businesses. These properties would have to extend the services from the property line into the home. These costs are expected to be approximately \$6,000 per home (note that costs will vary depending upon the distances from the home to the property line, location of the connection to the house, potential repairs to lawns/gardens/driveways, etc.). This matter is discussed in more detail within the Ainley Group Report.

# 3. Allocation of Capital Cost Benefit

As noted the above costs are identified to service both the existing and future developable properties. The benefit of the servicing will be allocated between the exiting properties and the developable properties. At this time, a high-level allocation estimate was considered by Ainley and preliminary allocations are as follows (note that this estimate will need to be further considered in subsequent studies as servicing plans and infrastructure locations are established):

- Existing Community Costs \$50-\$60 million
- Future Development Costs \$58-\$68 million

Allocation of costs components to benefitting properties will be considered based on the following schematic where:

- Most of the broader system will be shared by both existing and future development
- Localized mains will be constructed by the Town for existing properties
- Localized mains for future development will be constructed by developing landowners
- Costs to connect the house to the servicing located at the property line to be borne by existing property owners
- Costs to connect the new houses to the servicing located at the property line to be borne by developing landowners

# **Capital Costs – Allocation of Costs**

# 4. Summary of Capital Cost Financing Alternatives

# 4.1 Overview

Historically, the powers which Ontario municipalities have had to raise alternative revenues to taxation to fund capital services have been restrictive. While other provinces may allow certain approaches to funding, others may restrict these approaches. An often acknowledge document in the municipal realm is a 2006 document provided by the Canadian Council of Provincial/Federal Environment Ministers which provided a detailed overview of potential funding mechanisms. Some of the methods described therein would be a direct revenue to the municipality (e.g. grants, capital charges to properties) whereas others are cashflow methods (e.g. debt and 3P agreements). An overview of the alternatives provided therein is presented below along with the potential alternatives (highlighted) which are applicable in Ontario.

| Α | Alternatives                       | Revenue | Cashflow |
|---|------------------------------------|---------|----------|
|   | Sponsorships                       | X       |          |
|   | Innovative Transportation Revenues |         |          |
|   | & Incentives                       | X       |          |
|   | Government Service Partnerships    | X       |          |
|   | Strategic Budget Allocations       | X       |          |
|   | Utility Models                     | X       |          |
|   |                                    | I       |          |
| В | Bank                               |         |          |
|   | Bonds                              |         | Х        |
|   | Loans                              |         | X        |
|   | Revolving Loans/Provincial State   |         | x        |
|   | Trust Funds                        | x       |          |
|   | Securitizations Funds              | x       |          |
|   |                                    |         |          |

|   | Special Levies                     |         |          |

The methods of capital cost recovery available to municipalities are provided as follows:

# **RECOVERY METHODS**

- Development Charges Act, 1997, as amended
- Municipal Act
  - Rates
  - Sewer Area Capital Charges
  - Local Improvements
- Grants

# 4.2 Development Charges Act, 1997, as Amended

Development charges (DCs) are fees collected from new development, most often at the time a building permit is issued. The Development Charges Act gives authority to municipalities' DC By-laws for financing costs resulting from new growth.

Municipalities use these fees to help pay for the cost of infrastructure required to provide municipal services to new development, such as water, wastewater, roads, community centres and fire and police facilities. Fees are payable to both the Town and County levels of government, and the Boards of Education. Provincial Law limits the types of infrastructure costs development charges can fund. Most municipalities in Ontario use development charges to ensure that the cost of providing infrastructure to service new development is not borne by existing residents and businesses in the form of higher property taxes.

The Act allows for development to assist in cash flowing major projects in order to relieve the municipality of significant debt burdens. These types of agreements are based upon an agreement between a developer or group of developers. While a municipality cannot mandate an agreement, it may be necessary if the municipality cannot cash flow the project(s) themselves.

In certain instances, developers have assisted municipalities by also providing added contributions over and above the DC amount in order to assist funding the non-growth share. Bill 73 has made provisions that this may not be mandated but, once again may assist in instances where the projects are unaffordable.

# 4.3 Municipal Act, 2001

# 4.3.1 Part XII of the Municipal Act

Part XII of the Municipal Act, 2001 provides municipalities with broad powers to impose various types of capital and operating fees and charges. These powers include imposing fees or charges for services or activities provided or done by or on behalf of it.

Restrictions are provided to ensure that the form of the charge is not akin to a poll tax. Any charges not paid under this authority may be added to the tax roll and collected in a like manner. The fees and charges imposed under this part are not appealable to the O.M.B.

The legislations also permit municipalities to impose charges, by by-law, on owners or occupants of land who would or might derive benefit from the construction of sewage (storm and sanitary) or water works being authorized (in a Specific Benefit Area). For a by-law imposed under this section:

- A variety of different means could be used to establish the rate and recovery of the capital costs that could be imposed by a number of methods at the discretion of Council (i.e. lot size, frontage, number of benefiting properties, single detached equivalent, etc.). For example, dividing the costs by the number of units would provide for a cost per unit for the infrastructure costs;
- Rates could be imposed in respect to costs of major capital works, even though an immediate benefit was not enjoyed;
- Non-abutting owners could be charged;
- Recovery can be authorized against existing works, where a new water or sewer main was added to such works, "notwithstanding that the capital costs of existing works has in whole or in part been paid;"
- Charges on individual parcels could be deferred;
- Exemptions could be established;

Based on allocating the capital costs on a unit equivalent basis, the cost per property would be in the \$20,000 - \$25,000 range. The Municipal Act would allow the municipality to offer long term loans to property owners to allow for this cost to be paid off over 10, 15 or 20 years. Loan rates through Infrastructure Ontario are presently in the 3.5% - 4% range. In addition to these capital costs, the property owner would also have to provide the connection from the house to the property line (approx. \$6,000). This connection cost is specific to the homeowner and cannot be included in the municipal loan amount.

# 4.4 Local Improvement Regulation

Prior to 2001, local improvements were allowed under its own legislation (i.e. Local Improvement Act). With the reform of the Municipal Act in 2001, the Local Improvement Act was repealed and brought into the Municipal Act by regulation. The regulation presently provides:

• A variety of different types of works may be undertaken, such as watermain, storm and sanitary sewer projects, supply of electrical light, bridge construction, sidewalks, road widening, and paving.

- Page 8.
- Council may pass a by-law for undertaking such work on petition of a majority of benefiting taxpayers, on a 2/3 vote of Council, and on sanitary grounds, based on the recommendation of the Minister of Health. The by-law may go to the O.M.B., who might hold hearings and alter the by-law, particularly if there were objections.
- The entire cost of a work may be assessed only upon the lots abutting directly on the work, according to the extent of their respective frontages, using an equal special rate per metre of frontage.

# 4.5 Grant Funding Availability

# 4.5.1 Federal Infrastructure Funding

Phase 1 (April 1, 2016 - March 31, 2018)

Funding was provided by the Government of Canada to expressly help municipalities with repair and rehabilitation projects. Funding was mainly provided through the Clean Water and Wastewater Fund (CWWF) and Public Transit Infrastructure Fund (PTIF) in Federal Phase 1 projects. The CWWF was announced in Ontario on September 15, 2016. The Fund is \$1.1 billion for water, wastewater, and storm water systems in Ontario. The federal government provided \$569 million and Ontario and municipal governments provided \$275 million each.

Over 1,300 water, wastewater, and storm water projects have been approved in Ontario through the CWWF. In Ontario, PTIF accounted for nearly \$1.5 billion of the national total of \$3.4 billion. The program was allocated by ridership numbers from the Canadian Urban Transit Association. AMO understands that \$1 billion of Ontario's share has been approved.

# Phase 2: Next Steps

The federal government announced Phase 2 of its infrastructure funding plan with a total of \$180 billion spent over 11 years. In addition to the balance of funding for previous Green, Social, and Public Transit Infrastructure Funds (\$20 billion each, including Phase 1), the government has added \$10.1 billion for Trade and Transportation Infrastructure and \$2 billion for Rural and Northern. This funding must be implemented by agreements with each province and territory. Negotiations are ongoing and funding is designed to start flowing after the 2018 Budget, ramping up in the out years.

In Phase 2, Ontario will be eligible for \$11.8 billion including \$8.3 billion for transit, \$2.8 billion for green infrastructure, \$407 million for community, culture and recreation and \$250 million for rural and northern communities.

# Federal Gas Tax

The Federal Gas Tax is a permanent source of funding provided up front, twice-a-year, to provinces and territories, who in turn flow this funding to their municipalities to support local infrastructure priorities. Municipalities can pool, bank and borrow against this funding, providing significant financial flexibility. Every year, the Federal Gas Tax provides over \$2 billion and supports approximately 2,500 projects in communities across Canada. Each municipality selects how best to direct the funds with the flexibility provided to make strategic

investments across 18 different project categories, which include bother water and wastewater servicing.

# Ontario Government

The Province has taken steps to increase municipal infrastructure funding. The Ontario Community Infrastructure Fund (OCIF) was increased in 2016 with formula-based support growing to \$200 million, and application funding growing to \$100 million annually by 2018-19. As well, \$15 million annually will go to the new Connecting Links program to help pay for the construction and repair costs of municipal roads that connect communities to provincial highways. This is on top of the Building Ontario Up investment of \$130 billion in public infrastructure over 10 years starting in 2015.

# Summary of Future Grant Funding

The Town has been in discussions with the senior levels of government relevant to servicing these communities. Generally, commitments towards specific initiatives is not granted until the project has proceeded through the environmental and the public processes. Presently, no funding guarantees have been given however the initiatives have received positive feedback.

# 4.6 Debt Financing

Although it increases the overall cost to the taxpayer, debt issuance is used by municipalities to assist in cash flowing large capital expenditures. The use of debt may be used to loan existing property owners the funds to repay the capital charge over time.

The Ministry of Municipal Affairs regulates the level of debt incurred by Ontario municipalities, through its powers established under the Municipal Act. Ontario Regulations 403/02 provides the current rules respecting municipal debt and financial obligations. Through the rules established under these regulations, a municipality's debt capacity is capped at a level where no more than 25% of the municipality's own purpose revenue may be allotted for servicing the debt (i.e. debt charges). Hence, proper management of capital spending and the level of debt issued annually, must be monitored and evaluated over the longer-term period.

Presently, based on 20-year debt at prevailing interest rates, the municipality has a maximum debt limit of approximately \$24 million. Note that this amount is the maximum available for all services and fully utilizing it for one particular service would then limit the potential capital funding for other projects and services. Preserving some capacity for other servicing needs (e.g. water supply), the Town realistically may only make \$15-\$18 million available for this project.

# 4.7 Private/Public Partnership Agreements (3P's)

In 1993, the Province of Ontario passed legislation to amend the Municipal Act to allow municipalities to privatize municipal services (prior to which they needed special legislation). To date, there have been limited attempts at the full privatization of services however, there has been aspects of private initiatives present in many municipalities. Private contracts can range from simple construction contracts to full design/build/operate/finance contracts. Below is a summary of the more common forms of agreements.

| Model  | Construction | Operations | Capital<br>Investment or<br>Financing | Ownership at End<br>of Contract Term |
|--|--------------|------------|---------------------------------------|--------------------------------------|
| Operating<br>Maintain<br>Manage (OMM)        |              | Private    | Public                                | Public                               |
| Lease  | N/A          | Private    | Public                                | Public                               |
| Lease Develop<br>Operate (LDO)               |              | Private    | Private                               | Public                               |
| Design Build<br>Operate (DBO)                | Private      | Private    | Public                                | Public                               |
| Design-Build-<br>Finance-Transfer<br>(DBFT)  | Private      | Public     | Private                               | Public                               |
| Design-Build-<br>Finance-<br>Maintain (DBFM) | Private      | Operate    | Private                               | Public                               |
| Design-Build-<br>Finance-Operate<br>(DBFO)   | Private      | Private    | Private                               | Public                               |
| Build-Own-<br>Operate (BOO)                  | Private      | Private    | Private                               | Private                              |
| Build-Own-<br>Operate-Transfer<br>(BOOT)     | Public       | Private    | Private                               | Public                               |

Cost/benefit of the various forms of contracts are dependent upon the service being provided, the form of contract and the alternative methods in structuring the agreement. Generally, the borrowing costs for the private sector are higher than the borrowing costs available to municipalities however, there can be other aspects of the contract which can reduce other cost components and enhance the competitiveness of the contract. Note however, that this form of capital financing is assessed in the same way debt financing is considered for debt capacity purposes, hence this form of agreement does not mitigate the provinces maximum limits on incurring long term liabilities.

# 4.8 Municipal Services Corporation (MSC)

A municipality may create a municipal services corporation for the purpose of providing a system, service or thing that the municipality itself could provide such as water or wastewater services. The service, system or thing must be within the municipality's sphere of jurisdiction under section 11 of the *Municipal Act, 2001*. To date, there is limited use of this legislative authority in Ontario.

Municipal services corporations may be established under the Business Corporations Act or the Corporations Act. The Corporations Act likely would be used if the municipal services corporation was going to be a not-for-profit organization. Before creating a MSC a municipality must prepare a business case and consult the public.

There are limitations and potential impacts which need to be considered prior to proceed to set up a MSC. Some of the considerations are provided below:

- MSC normally have a higher costs of borrowing (i.e. loans)
- Transferring an existing municipal service to a MSC can reduce a municipality's debt capacity however for a new service, it may provide for additional borrowing ability
- MSC's may not be eligible for certain grants and subsidies
- As a MSC is a Business Corporation, they do not have to same powers as a municipality hence there may be limitations in exercising certain authorities

# 4.9 Financial Observations for Erin

The options available to Erin for financing capital infrastructure are somewhat limited. Based on the above discussions:

- Town needs to pursue Federal/Provincial grants to reduce the overall impact onto property owners;
- Grants are also needed to be able to remain within the Town's debt capacity limits;
- Municipal Act (Part 12) charges for existing properties would be the primary basis for recovery. Distributing the capital cost on a single detached equivalent may be most equitable approach to distributing cost amongst existing properties;
- For growth related costs, developing landowners would need to pay their charges by upfront financing to offset the debt burden to the Town;
- Some level of financial assistance by developing landowners may assist in achieving financial affordability of the overall project;
- Staging of the works could be considered, as the Wastewater Treatment Plant and Collection System could be constructed in stages.

# 5. Operating Costs for the Wastewater System

Upon completion of the Wastewater system, operating costs would be incurred to collect and treat the wastewater. Most municipalities recover these funds via a wastewater rate similar to the rate structure imposed for the municipal water system.

Wastewater rates typically include a fixed/basic charge (monthly/bi-monthly) and a usage rate linked to the household water use. Often for wastewater, these rates are typically slightly higher than water rates. Wastewater rates will likely reduce as new customers are added.

The SSMP identified an average cost per household of \$422 per year to operate the system based on a 6,000 population. However, this did not include system capital cost recovery. Generally, a new system is predominantly operations-related and has minimal capital-related costs. However, some level reserve fund contribution may be made towards the long-term lifecycle of the system or for contingency purposes.

A sampling of wastewater operating costs was undertaken for a number of municipalities in the general area of the Town. The costs per customer for the direct operating costs (net of capital financing and reserve transfers) are as follows:

| Municipality      | Operating costs (net<br>of Capital and<br>Reserve transfers) | Number of Customers | Operating Costs per<br>Customer |
|-------------------|--|---------------------|---------------------------------|
| Centre Wellington | 3,156,300  | 6,742               | 468                             |
| Guelph-Eramosa    | 955,019  | 1,639               | 583                             |
| Wellington North  | 1,319,800  | 3,231               | 408                             |
| Orangeville       | 3,747,100  | 10,067              | 372                             |
| Average           |  |                     | 458                             |

**Operating Costs Per Customer (2018)** 

Based on other local municipalities with similar size, it is anticipated that the annual operating costs per customer range from \$400 to \$500 per year.

# 6. Conclusion

Based on the analysis provided above, the magnitude of the capital cost is outside the Town's financial affordability without external funding. The capital costs total over \$118 million and the Town has a maximum debt capacity of approximately \$24 million. However, considering the other capital need of the Town, only about \$15-\$20 million may be made available.

For this project to proceed, the growth-related portion of the costs (\$58-\$68 million) must be upfront financed by developing landowners. The Development Charges Act provides for various forms of cashflow agreements (i.e. front-ending agreements, prepayment agreements) which would allow for the municipality to facilitate the growth component of the works.

For the portion of the cost which benefits existing properties (\$50-\$60 million), the municipality must receive external funding of approximately (\$35-\$45 million). This funding would be required from either federal/provincial grant and/or contributions from the developing landowners. Applying this funding would reduce the cost from \$20,000-\$25,000 per unit to approximately \$7,500. Each property will also be responsible for connecting to the sewer with most properties costing \$4,000 to \$8,000. A total of \$11,500 to \$15,500.

A final alternative which could be considered if no external funding is available, is to stage the construction of the service. The first stage may allow for the growth component of the infrastructure (which services development lands) to proceed and be funded by the developing landowners. The second stage (and possibly subsequent stages) could then allow for portions of the existing community to be serviced. This approach would allow the Town to manage its debt capacity limit and service existing properties as it is financially feasible.

Appendix - V Notice of Completion

# CORPORATION OF THE TOWN OF ERIN Urban Centre Wastewater Servicing Class Environmental Assessment Notice of Completion of Environmental Study Report

In 2014, the Town of Erin completed a Servicing and Settlement Master Plan (SSMP) to address servicing, planning and environmental issues within the Town. The study area for the SSMP included Erin Village and Hillsburgh as well as a portion of the surrounding rural lands. The SSMP was conducted in accordance with the requirements of the Municipal Class Environmental Assessment (Class EA), which is an approved process under Ontario's Environmental Assessment Act and addressed Phase 1 & components of Phase 2 of the Class EA planning process.

The Urban Centre Wastewater Servicing Class Environmental Assessment (UCWS EA) is a continuation of the study, closing out Phase 2 of the study and initiating Phases 3 & 4 of the planning process to determine the preferred design alternative for wastewater collection, treatment and disposal. Through the completion of this Class EA, it has been determined that there is potential to grow the community to a residential population of approximately 14,600 people. The UCWS EA has therefore proceeded with planning for the community on this basis.

The Class Environmental Assessment process has followed the planning and design process for Schedule 'C' projects as described in the Municipal Class Environmental Assessment Document (October 2000 as amended in 2007, 2011 & 2015), published by the Municipal Engineer's Association. The Environmental Study Report has been completed and, by this Notice, is being placed in the public record for review and comment. Subject to comments received as a result of this Notice and the receipt of necessary approvals, the Town intends to proceed to seek funding for the implementation of the project. The total estimated cost of the project is \$118,200,000 to be shared between the Town and Developers.

The Environmental Study Report will be available on Monday; May 14, 2018 on the Town website at <u>www.erin.ca/town-hall/wastewater-ea</u> along with hard copies being available at the following three locations:

- Corporation of the Town of Erin Municipal Office 5684 Trafalgar Road Hillsburgh, ON, N0B 1Z0
- Erin Community Centre/Centre 2000 (Library) Boland Drive, Erin, ON, N0B 1T0
- Hillsburgh Library
   98B Trafalgar Road PO Box 490
   Hillsburgh, ON, N0B 1Z0

If you have any outstanding concerns about this project, please address them to the following individuals:

Lisa Campion Deputy Clerk Corporation of the Town of Erin 5684 Trafalgar Road Hillsburgh, ON N0B 1Z0 Email: Lisa.Campion@erin.ca Joe Mullan, P. Eng. Ainley & Associates Limited 195 County Court Boulevard, Brampton, ON, L6W 4P7 Telephone: (905) 452-5172. Email: erin.urban.classea@ainleygroup.com

If concerns regarding this project cannot be resolved in discussion with the Town, the individual with the concern may request that the Minister of the Environment and Climate Change (MOECC) to order a change in the project status and require a higher level of assessment under an individual Environmental Assessment process (referred to as a Part II Order). Detailed reasons must be provided with the request and the request must be sent to each of the following:

Ministry of the Environment and Climate Change 77 Wellesley Street, West 11th Floor, Ferguson Block Toronto, ON, M7A 2T5 Ministry of the Environment and Climate Change Environmental Approvals Branch 135 St. Clair Avenue West, 1<sup>st</sup> Floor, Toronto, ON, M4V 1P5

Lisa Campion Deputy Clerk Corporation of the Town of Erin 5684 Trafalgar Road Hillsburgh, ON N0B 1Z0

If there is no request received by June 13, 2018 the Town will proceed to seek funding for the design and construction of the wastewater system as presented in the Environmental Study Report.

Please note that all personal information included in a Part II Order submission - such as name, address, telephone number and property location - is collected, maintained and disclosed by the Ministry of the Environment and Climate Change for the purpose of transparency and consultation. The information is collected under the authority of the Environmental Assessment Act or is collected and maintained for the purpose of creating a record that is available to the general public as described in s.37 of the Freedom of Information and Protection of Privacy Act. Personal information you submit will become part of a public record that is available to the general public unless you request that your personal information remain confidential. For more information, please contact the Ministry's Freedom of Information and Privacy Coordinator at 416-327-1434.

This notice issued May 3, 2018.

ESR Review Comments, Part II Order Requests, and Resolutions

June 27, 2018

Ainley Group 195 County Court Blvd., Suite 300 Brampton, Ontario L6W 4P7

Attention: Preya Balgobin, P.Eng Senior Project Manager

Re: Town of Erin Urban Centre Wastewater Serving Schedule C EA

CVC has reviewed the Environmental Study Report (ESR) for the Town of Erin Urban Centre Wastewater Servicing Class Environmental Assessment (Ainley, April 2018); Response to CVC Comments on Project Supporting Studies (Ainley, April 10, 2018) and Response to CVC letter (Ainley, June 14, 2018).

CVC has no objection to the approval of the ESR and find the response comments to our previous concerns satisfactory; however, we provide the following comments for your consideration during future phases of the project including detail design.

#### **Ontario Regulation 162/06**

Portions of the project (outfail, a number of sewage pumping stations, some of the sewers) are within regulated areas and as result are subject to the Development, Interference with Wetlands, and Alterations to Shorelines & Watercourses Regulation (CVC Ontarlo Regulation 160/06). This regulation prohibits altering a watercourse, wetland or shoreline and prohibits development in areas adjacent to the Lake Ontario shoreline, river and stream valleys, hazardous lands and wetlands, without the prior written approval of CVC (i.e. the issuance of a permit).

With respect to the sewage pumping stations, although typically essential services should be located outside the natural hazards, recognizing that pump stations need to be located at low elevations, CVC finds it acceptable in principle that the pump stations are located within the flood plain subject to the hazard being minimized and are adequately addressed through detail design including, locating in the area of least hazard, floodproofing of structures, improved back-up systems and providing suitable access during Regional Storm conditions. However, CVC does not support the location of essential infrastructure within the erosion hazard.

It should be noted that the preferred location of H-SPS 2 is within the erosion hazard of the West Credit River. CVC does not support this location. By relocating the station to the north side of Mill Street the pump station would be outside the erosion hazard. In addition H-SPS 2 is subject to approximately 1.44 metres of flooding during Regional Storm conditions. This is beyond the typical floodproofing depths and as a result special design considerations are going to be required during detail design. Options need to be considered ....2/

to relocate H-SPS 2 to outside the floodplain or at minimum to an area of less flooding.

E-SPS 1 and E-SPS also appear to be within the floodplain; however, they would be subject to less flooding that can be more readily addressed during detail design including relocating outside of the floodplain or to area of least flooding.

#### West Credit Assimilative Capacity Study Final - December 2017

CVC still has concerns about the potential impacts of exceeding chronic chloride water quality guidelines at full build out flows.

We would just like to reiterate that the results show that under full build out effluent flows instream chloride concentrations will exceed aquatic guidelines for chronic exposure. At the present time, it is not technically feasible to remove chloride in the treatment process; therefore the emphasis should be placed in controlling the input of chloride at the source. It is recognized that water softeners are a significant source of chloride/salts in the wastewater stream specifically in areas on groundwater drinking water supply.

In order to minimize the impacts to aquatic life including brook trout, CVC has the following recommendations for the Town of Erin to be addressed in the future:

- New Developments: That the subdivision agreements for new subdivisions contain conditions that require the installation of high efficiency water softeners for each lot.
- Existing Developments: That the Town of Erin consider funding available to private residents to upgrade plumbing infrastructure on private property to tie into the new sewer lines. It is recommended that the installation of high efficiency water softeners be part of the plumbing upgrades included in the funding model.
- Education Program: That the Town of Erin consider providing continuous education to Erin residents during the implementation of new wastewater servicing in the Town. CVC can provide information in different media formats on how residents can minimize their environmental impacts on their own property including the installation of high efficiency water softeners

#### **Thermal Impact Assessment**

CVC has no objection to the proposed outfall location at Winston Churchill Boulevard. Based on the available data this location presents the least potential impact to the aquatic community out of the 3 potential sites proposed in the ESR.

For a variety of reasons, the existing stream temperatures in the West Credit River at the proposed discharge location are already warmer than preferred. To reduce the possibility of warming of the watercourse further, as part of detail design, opportunities to cool the discharge should be reviewed.

....3/

#### **Overflow Risk Management**

CVC is satisfied with the overflow risk management technical memorandum including the differentiation of potential causes of spill and bypasses and specific mitigation measure for each type. CVC agrees that management inspections and preventative maintenance is key to the long term management of wastewater spills risks to the West Credit watershed.

CVC would like further details in the final design stage of this project on how the mitigation actions recommended in the overflow risk management memo will be implemented into final design (e.g. duel pumps, twin power, flow logger with alarms) stormwater and sanitary operations (regular inspection and maintenance programs) and in policy (sewer use by-law, spill response plan).

#### Conclusion

As stated above, CVC as no objection to the approval of the ESR. CVC would like to participate in future phases in the project including Site Plan and CVC Permitting, ECA permits, and development of monitoring plans (including temperature, nitrate).

CVC would also be willing to participate in any future meetings that our related to our areas of concern.

Do not hesitate to contact the undersigned if you have any additional questions.

Yours truly,

Liam Marray Senior Manager Planning Ecology

## Attn: Mr. Liam Marray Senior Manager Planning Ecology

#### Ref: Town of Erin, Urban Centre Wastewater Servicing Class EA ESR Review Comments

Thank you for your June 27, 2018 comments on the Environmental Study Report (ESR) for the abovenoted project. For your convenience, we have reprinted the CVC's comments followed by our responses in red italics.

## CVC Comment:

Portions of the project (outfall, a number of sewage pumping stations, some of the sewers) are within regulated areas and as a result are subject to the Development, Interference with Wetlands, and Alterations to Shorelines & Watercourses Regulation (CVC Ontario Regulation 162/06).

It should be noted that the preferred location of H-SPS 2 is within the erosion hazard of the West Credit River. CVC does not support this location. By relocating the station to the north side of Mill Street the pump station would be outside the erosion hazard. In addition, H-SPS 2 is subject to approximately 1.44 meters of flooding during the Regional Storm conditions. This is beyond the typical flood proofing depths and as a result, special design considerations are going to be required during detailed design. Options need to be considered to relocate H-SPS 2 to outside the floodplain or at a minimum to an area of less flooding.

E-SPS 1 and E-SPS also appear to be within the floodplain; however, they would be subject to less flooding that can be more readily addressed during detailed design including relocating outside of the floodplain or to area of least flooding.

**Response:** The project team recognizes that the design of all proposed facilities must comply with Ontario Regulation 162/06. It is also recognised that the final siting of all facilities must be subject to planning and site plan approval that will take into consideration, flood plain mapping as well as operational considerations. It is the opinion of the project team that more detailed, localized flood plain mapping will be required to support the approval process and to identify the most appropriate sites within the areas identified in the ESR. This will be clarified within the final ESR.

## CVC Comment:

CVC still has concerns about the potential impacts of exceeding chronic chloride water quality guidelines at full build out flows.

We would just like to reiterate that the results show that under full build out effluent flows instream chloride concentrations will exceed aquatic guidelines for chronic exposure. At the present time, it is not technically feasible to remove chloride in the treatment process; therefore, the emphasis should be placed in controlling the input of chloride at the source. It is recognized that water softeners are a significant source of chloride/salts in the wastewater stream specifically in areas on groundwater drinking water supply.

In order to minimize the impacts to aquatic life including brook trout, eve has the following recommendations for the Town of Erin to be addressed in the future:

- New Developments: That the subdivision agreements for new subdivisions contain conditions that require the installation of high efficiency water softeners for each lot.
- Existing Developments: That the Town of Erin consider funding available to private residents to upgrade plumbing infrastructure on private property to tie into the new sewer lines. It is recommended that the installation of high efficiency water softeners be part of the plumbing upgrades included in the funding model.
- Education Program: That the Town of Erin consider providing continuous education to Erin residents during the implementation of new wastewater servicing in the Town CVC can provide information in different media formats on how residents can minimize their environmental impacts on their own property including the installation of high efficiency water softeners

# **Response:** The project team recognizes and agrees with the concerns of the CVC with respect to the discharge of chlorides and agree with the approach to minimizing the introduction of chlorides to the proposed system. The CVC recommendations will be incorporated into the final ESR document.

#### CVC Comment:

CVC is satisfied with the overflow risk management technical memorandum including the differentiation of potential causes of spill and bypasses and specific mitigation measure for each type. CVC agrees that management inspections and preventative maintenance is key to the long-term management of wastewater spills risks to the West Credit watershed.

CVC would like further details in the final design stage of this project on how the mitigation actions recommended in the overflow risk management memo will be implemented into final design (e.g. duel pumps, twin power, flow logger with alarms) stormwater and sanitary operations (regular inspection and maintenance programs) and in policy (sewer use by-law, spill response plan).

**Response:** The project team recognises the concern of CVC and MECP with respect to overflow risk management. The final ESR will clarify that overflow risk management must be addressed during detailed design and approval to the satisfaction of MECP and CVC.

Yours truly,

**AINLEY & ASSOCIATES LIMITED**

# Re: MOECC Comments on the Town of Erin Urban Centre Wastewater Servicing Class EA

The ministry's involvement with the Town of Erin has a long project history starting with the BM Ross Settlement and Servicing Master Plan. Accordingly, our familiarity with the project is well-established. Similarly, staff at the district and regional levels maintained a close working relationship with the project team in light of our dual role of ensuring the integrity of the environmental assessment process, and our role of environmental protection and eventual approval of the proposed wastewater treatment plant.

This focused our review of the ESR to the issues of environmental assessment process and technical issues that require resolution to enable the next phases of detailed design and eventual application for approval.

## Issues Specific to protection of water resources and subsequent approvals:

- With respect to assimilative capacity and outfall selection, we are satisfied that the ESR has included effluent criteria, thermal assessment on brook trout and chloride monitoring that have been agreed upon during previous discussions and reviews;
- We have reviewed the spills risk management plan that has been included as an appendix to the ESR and we conceptually agree with the proposal. We recognize that this is more suited to the role of the Review Engineer;
- We support the CVC in its encouragement that all efforts be taken by the Town to investigate and implement at-source chloride minimization (from the use of water softeners);
- We recognize that details as to outfall design and monitoring of influent, effluent and receiving waters will be finalized at the permitting stage; and
- Once all outstanding issues have been resolved, the inclusion of this letter as part of the supporting documentation for the OWRA approval should negate the need for the Approvals Engineer to engage in lengthy consultation with this office provided

that the supporting documentation replicates that which has already been agreed upon.

## Issues specific to the environmental assessment process;

 It is noted that 3 indigenous communities were notified of this project along with notices for all of the PICs. However, having reviewed the ESR, I was not able to find any correspondence from any of the indigenous communities to show whether they had any concerns. Please note that if there has been no response from these communities, the Town should make further attempts to contact these communities to obtain written confirmation that they do not have concerns with the project, or if they do have concerns, the manner in which the Town intends to address them.

## Issues raised by the Ministry of Natural Resources and Forestry:

MNRF has expressed many concerns with the manner in which the outfall location
was chosen and about the assumptions and methodology used in the assimilative
capacity determination due to concerns as to the impacts to brook trout and their
spawning habitat. It is our expectation that the consultants will provide additional
information/response to these concerns.

Given the shared interests, MOECC is also prepared to participate in any meetings that may be convened to address MNRF's concerns.

This concludes our comments. Should you have any questions, please do not hesitate to contact me either by phone at (905) 521-7864 or via email at <u>Barbara.slattery@ontario.ca</u>.

Barbara Matery

Barbara Slattery EA/Planning Coordinator

Ministry of the Environment, Conservation and Parks 119 King Street West, 12th Floor Hamilton, Ontario L8P 4Y7

## Attn: Ms. Barbara Slattery EA/Planning Coordinator

## Ref: Town of Erin, Urban Centre Wastewater Servicing Class EA Response to MECP Review Comments on ESR

Thank you for your June 14, 2018 comments on the Environmental Study Report (ESR) for the abovenoted project. For your convenience, we have reprinted the MECP's comments followed by our responses in red italics.

## **MECP Comment:**

We support the CVC in its encouragement that all efforts be taken by the Town to investigate and implement at-source chloride minimization (from the use of water softeners);

**Response:** The project team agrees with the recommendations of the MECP and CVC on the issue of chlorides from water softeners within the Town. A summary of the potential issue and recommended actions for the Town will be documented in the final ESR subsequent to the management of Part II Order requests.

## **MECP Comment:**

It is noted that 3 indigenous communities were notified of this project along with notices for all of the PICs. However, having reviewed the ESR, I was not able to find any correspondence from any of the indigenous communities to show whether they had any concerns. Please note that if there has been no response from these communities, the Town should make further attempts to contact these communities to obtain written confirmation that they do not have concerns with the project, or if they do have concerns, the manner in which the Town intends to address them.

**Response:** As recognized in the MECP comment the project team developed a listing of indigenous communities considered to be stakeholders at the initiation of the project and each were included in all notifications for the Class EA (Notice of Commencement, PIC #1 and #2, and Notice of Completion). In addition, to the issuance of the Notice of Completion, follow-up emails to elicit comments for the Notice of Completion (ESR) were sent to the following indigenous stakeholders on May 11, 2018:

- Haudenosaunee Confederacy Secretary Hohahes Leroy Hill
- Haudenosaunee Confederacy Hazel Hill
- Mississauga of the New Credit First Nation Chief Stacey LaForme
- Six Nations of the Grand River Territory Lonny Bomberry
- Six Nations of the Grand River Territory Caron Smith
- Six Nations of the Grand River Territory Joanne Thomas, Dawn LaForme, Paul General
- Ministry of Aboriginal Affairs Leslie Brewer (follow-up email was sent on May 15, 2018)

There have been no responses from these communities outlining specific concerns with the project at any notification stage or the additional follow-up emails to elicit comment.

## **MECP Comment:**

MNRF has expressed many concerns with the manner in which the outfall location was chosen and about the assumptions and methodology used in the assimilative capacity determination due to concerns as to the impacts to brook trout and their spawning habitat. It is our expectation that the consultants will provide additional information/response to these concerns.

**Response:** The project team is preparing a response to the MNRF comments on the ESR. Both MECP and CVC will be copied on the response and any subsequent correspondence. Should a meeting be required, MECP and CVC will be invited.

> Re: Town of Erin Urban Centre Wastewater Servicing Municipal Class Environmental Assessment – Environmental Study Report – Town of Erin, County of Wellington – MNRF Comments

Mr. Mullan,

The Ministry of Natural Resources and Forestry (MNRF) can confirm receipt of the October 31, 2018 response from Ainley & Associates Ltd. and Hutchinson Environmental Services Ltd., regarding the Town or Erin Urban Centre Wastewater Servicing Municipal Class Environmental Assessment (EA). It is understood that the purpose of this response is to address the Ministry's June 12, 2018 review of the EA Notice of Study Completion and the Environmental Study Report (ESR).

The ESR concludes that the preferred alternative for the proposed wastewater treatment plant (WWTP) has been scoped to two locations. These options will be considered further during the implementation phase of the project, and they include:

- Lands owned by Halton Crushed Stone (HCS) at the southwest corner of Wellington Road 52 and 10<sup>th</sup> Line. This site may be selected if land acquisition is required after the planned mineral aggregate resource extraction on the site has been completed; or
- Lands north of Wellington Road 52. This site may be selected if land acquisition is required before mineral aggregate resource extraction on the HCS lands has been completed.

The ESR also concludes that the preferred alternative for the WWTP outfall is in the West Credit River, on the west side of Winston Churchill Boulevard.

This stretch of the West Credit River represents a high-quality brook trout population. The Credit River Fisheries Management Plan (CRFMP, 2002) notes that resident brook trout populations are an excellent indicator of ecosystem health. As such, a management objective of the CRFMP is to protect brook trout populations. The importance of brook trout, and the sensitivity of these species to water quality changes, is documented in the ESR. Based on our Ministry's mandate to promote healthy and sustainable ecosystems, conserve biodiversity, and wisely manage natural resources, we encouraged

To meet with our staff please be sure to call ahead and make an appointment. For general information visit: <u>www.mnr.gov.on.ca</u> or <u>www.ontario.ca</u> the Town to explore whether there are less aquatically sensitive locations in the subwatershed to site the proposed WWTP. However, MNRF understands that the purpose of the Municipal Class EA is to consider and to balance the potential impacts of a project on the environment in a broad sense. Should this project be approved, MNRF staff are available to provide advice to the project team to help avoid or mitigate impacts to the brook trout population.

MNRF staff appreciates the project team's attention to our concerns regarding the sensitivity of this stretch of the West Credit River to the brook trout population. MNRF is satisfied with the project team's suggestions and commitments, however, we have additional comments below for your consideration. Additionally, it appears that many of the responses from Ainley Group suggest that MNRF's comments from our June 12, 2018 letter could be addressed through MECP's review and potential authorizations. It is recommended that the project team follow up with MECP to address any new commitments resulting from the project team's correspondence with MRNF.

#### MNRF Comments

#### Aggregate Resources

Comment #2:

- MNRF staff notes that the preferred site 2B (after extraction) falls within lands owned by HCS, which has been identified in the reporting. HCS has submitted an Aggregate Resources Act (ARA) licence application for the subject lands, which has been reviewed by MNRF. The application is still going through the municipal approvals process and is currently waiting for the zoning to be finalized. Once the municipal process is completed, a hearing date needs to be scheduled at the Local Planning Appeal Tribunal (LPAT). Currently, cases for the LPAT are being scheduled in 2020.
- Additionally, you may want to take into consideration the potential life-span of the pit. If the
  subject lands become licensed, the timeline for full extraction is likely unknown and could take
  years before all the material is extracted, the lands are rehabilitated, and the licence is surrendered
  with MNRF. It is recommended that you consult with HCS to get a better understanding of how long
  they anticipate that extraction may take, if these lands become licensed.
- In your October 31<sup>st</sup>, 2018 letter, the project team notes that if this site is ultimately selected, MNRF will be consulted in the context of the ARA licence conditions. For clarification, the site (if the licence is approved) will need to be rehabilitated and the licence surrendered in advance of any WWTP construction.

#### Temperature Assessment

Comment #22

As acknowledged by the project team, brook trout are highly sensitive to thermal impacts. Taking this sensitivity into consideration, MNRF suggests that it would be beneficial to develop a mitigation strategy (or other approach) to address exceedances in the predicted temperature levels. This may be important to ensure the brook trout population would not be adversely impacted under such circumstances.

#### Comments #25, #26, and #27:

We appreciate the rationale for limiting the number of spawning surveys to limit impacts on the spawning brook trout population. MNRF notes, however, that construction of this project could be

a few years out if approved. As such, we recommend conducting additional spawning surveys in advance of the anticipated date of construction. This approach would help to ensure that any potential changes relevant to protecting the brook trout population are identified to inform mitigation strategies.

#### Closing

The MNRF appreciates the opportunity to review and comment on Ainley Group's response to MNRF's June 12, 2018 letter on the regarding the Town or Erin Urban Centre Wastewater Servicing Municipal Class EA.

We hope that the above comments will help to inform the EA process moving forward. Please contact the undersigned if further comment or clarification is required.

Regards, Thekena

SENT BY EMAIL

#### Re: Comments on Notice of Completion of Environmental Study Report Urban Centre Wastewater Servicing Class Environmental Assessment Town of Erin

Dear Lisa Campion and Joe Mullan:

The Region of Peel appreciates the opportunity to clarify our comments sent on June 12, 2018.

#### **Source Water Protection**

It is our understanding that a Preliminary Geotechnical Report was prepared to assist with siting the potential facilities associated with this Environmental Assessment. This report characterized much of the study area as having vulnerable aquifers and wellhead protection areas. It is anticipated that a geotechnical / hydrogeological assessment will be completed to identify potential impacts on groundwater and surface waters, as per requested by the Credit Valley Conservation Authority (CVC), however, this study will be carried out at the implementation stage of this Class Environmental Assessment process. At this conceptual stage of this Environmental Assessment, Peel Region does not require a geotechnical / hydrogeological assessment. The Region accepts the plans for this work to be carried out later in the process and requests that staff be involved in the review of these results to ensure the protection of the sources of water for the surrounding area of the project.

Further, it is our understanding that the Environmental Study Report (ESR) to be completed later in this Class Environmental Assessment will investigate the potential for spills and incorporate a monitoring plan and a spill contingency and mitigation plan to manage such an event. Peel Region supports this best management practice and would, as above, request the opportunity to review these plans.

#### **Concluding Remarks**

If you have any questions or concerns, please contact me at your earliest convenience at 905-791-7800 ext. 4710, or by email at: wayne.koethe@peelregion.ca

Sincerely,

W. Doetto

#### Source Water Protection

It is our understanding that a Preliminary Geotechnical Report was prepared to assist with siting the potential facilities associated with this Environmental Assessment. This report characterized much of the study area as having vulnerable aquifers and wellhead protection areas. It is anticipated that a geotechnical / hydrogeological assessment will be completed to identify potential impacts on groundwater and surface waters, as per requested by the Credit Valley Conservation Authority (CVC), however, this study will be carried out at the implementation stage of this Class Environmental Assessment process. At this conceptual stage of this Environmental Assessment, Peel Region does not require a geotechnical / hydrogeological assessment. The Region accepts the plans for this work to be carried out later in the process and requests that staff be involved in the review of these results to ensure the protection of the sources of water for the surrounding area of the project.

Further, it is our understanding that the Environmental Study Report (ESR) to be completed later in this Class Environmental Assessment will investigate the potential for spills and incorporate a monitoring plan and a spill contingency and mitigation plan to manage such an event. Peel Region supports this best management practice and would, as above, request the opportunity to review these plans.

**Response:** The project team recognises the concern of the Region with respect to source water protection and overflow risk management. As such the final ESR will clarify that additional assessments and overflow risk management in relation to source water protection must be addressed during the detailed design & approval stage and that the Region of Peel must be included in the review and comment of the proposed measures prior to the project proceeding to implementation.

If you have any questions or additional comments, please do not hesitate to contact us.

Yours truly,

CC.

Dear Sir or Madam,

#### Re: Erin Wastewater Servicing Study File 115157 35 Main Street, Erin, Ontario

I am the secretary/treasurer for the shareholders of 598622 Alberta Ltd., and as such have authority to speak for the company.

You requested permission to run a sewer pipe under the lawn at 35 Main Street, Erin, Ontario in the above noted study in your letter of 23 March 2018. You claim that running a sewer pipe under 35 Main Street is necessary to service the west side of the business section on Main Street.

We expressly deny our permission to run any sewer pipe across the property at **35 Main Street, Erin.** The plan enclosed with your letter clearly shows no connection whatsoever between servicing behind the west side businesses on Main Street and the necessity of running a sewer pipe across 35 Main Street, which is located on the east side of Main Street. It is therefore unnecessary and a wholly unreasonable disruption to the quiet enjoyment of our land.

If you have any questions or comments about this letter or the position of 598622 Alberta Ltd., please contact me at this address or by telephone at 519-833-2531.

Yours sincerely,

598622 Alberta Ltd., LEEven

Colleen McEnery

Ref: Corporation of the Town of Erin Urban Centre Wastewater Services Class Environmental Assessment (Phase 3 & 4)

Dear

On behalf of the Town of Erin, we wish to thank you for your interest in the above-mentioned Class EA. We refer to your April 18, 2018 letter concerning the above noted project and the property at 72 Main Street in Erin Village. For convenience we have attached your comments to this letter.

As noted by you, we did refer your client to the project website for information on the preferred sewer alternative and we do apologise that we were not more specific as there are now many documents on the project website. The preferred collection system with the sewers on either side of Main Street is shown in the Collection System Technical Memorandum.

This alternative was developed due to concerns over disruption from construction of a sanitary sewer on Main Street as well as the high cost of connecting existing properties to a sewer on Main Street, particularly on the north side where properties are lower than the street. The split sewers on either side of Main Street should be much more beneficial to the properties in this area of the Village, albeit that it will require negotiation of easements through existing properties.

The exact alignment and depth of the proposed sewers will need to be determined after a more detailed survey of existing properties during detailed design. The alignment will need to address access to the sewer for all of the properties and minimise the impact on these properties. The depth of the sewer below ground would be sufficient to pick up flows from existing septic systems. Any damage caused to properties would be completely restored. This additional investigations and negotiations would not commence until the Class Environmental Assessment is complete and after the Town have received financial assistance such that the project could moving ahead with detailed design and ultimately construction.

Construction would not involve changing the water level in the Mill Pond. We do understand the environmental sensitivity of the area. Prior to construction, a more detailed Environmental Management Plan would need to be prepared in support of a permit from Credit Valley Conservation, who have been involved in the study and have reviewed and commented on the reports.

Construction across each property should only take a few days, however due to the narrow corridor; the contractor would likely require access along the entire easement while the sewer is being constructed. This could take up to one month.

As noted, the Town will not be in a position to negotiate an easement for the proposed sanitary sewer with concerned property owners, until the Class EA is complete and the Town has the requisite planning and financing in place for the project. At this time, the project is in Phase 4 of the Class EA

with the Environmental Study Report (ESR) prepared and the Notice of Completion being published on May 14, 2018 which initiated the 30-day public review period associated with the Class EA.

Yours truly,

By email: erin.urban.classea@ainleygroup.com

Dear Sirs/Madames

RE: File 115157 - 72 Main St., Erin, ON

I am writing in response to yours of March 23, 2018 which was received by my client on April 6, 2018.

On your suggestion my client has visited the wastewater-ea section on the Township website and in particular the Natural Environment Report (Ainley Group Ref J160005) dated Dec 18, 2017.

I refer you to the maps on pgs 2, 11, 14, 16, 30 & 48 which show no sewer on the west side of Main Street between Church (to the north) and Charles (to the south), and yet the map enclosed with your letter of March 23 does indeed show a sewer on the west side of Main Street, between Church and Charles. This apparent anomaly is curious, particularly as the sewer depicted in your recent letter appears to be located immediately adjacent to the lower millpond which presumably will require approval by Credit Valley Conservation.

Does the plan include draining the millpond or installing the sewer pipe above ground?

My client is also interested in understanding how properties that do not have direct access to the proposed pipe will access the pipe.

My client will also be pleased to receive clarification as to the provisions for remediation of property, specifically as to the replacement of existing fencing, mature trees and paved parking.

My client will also require information about the projected length of time required for site preparation, installation and remediation, and for potential security issues attached to alternative parking arrangements that may be necessitated by construction.

Clarification on these points will be useful, particularly as your letter requests my client's "agreement" without specifying what it is that my client is being asked to agree to.

Finally, my client has made note of the level of environmental sensitivity expressed in the Report J160005, and wishes to advise that the banks of the millpond are habitually used by nesting snapping turtles and by nesting Canada geese.

Yours truly Robert H Rout liffe LLB

Cc: Subject: Attachments: Judy Mabee June 12, 2018 3:48 PM Minister, MOECC (MOECC); erin.urban.classea@airisleygroup.com; sylvia.jonesco@pc.ola.org; Allan Thompson; Barb Shaughnessy B.C.O. Board; Ian Sinclair Response to Sewage Treatment Plant EA BCO Erin Waste Management v2.docx

Dear Sir or Madam, Attached is a response from the Belfountain Community Organization regarding the Erin Sewage Treatment Plant EA. The hamlet of Belfountain is very corcerned about the quality of the effluent discharged into the Credit River. Regards,

Judy Mabee President

# Erin Waste Management Review Action Required

Committed to Preserving the Rural, Heritage and Environmental Integrity of the Hamlet of Belfountain and its Environs

Project Manager Ainsley & Associates Limited erin.urban.classea@ainsleygroup.com. CC to: Christine Furlong, Triton Engineering Services Limited

This letter is in response to **The Town of Erin, Urban Centre Wastewater Class EA Phase 1 & 2 Report.** The Belfountain Community Organization has concerns regarding the proposed Wastewater treatment plan for Erin/Hillsburg being proposed for discharge into the Credit River. Our concerns include but are not limited to the below:

- 2.2 Principles of Environmental Planning Consultation with Affected parties Hamlet of Belfountain residents have not been adequately consulted. The residents of Belfountain live down river from the proposed discharge site. Many of these residents' source their drinking water from the Credit River. There is concern of how the proposed sewage plant and subsequent effluent discharge will affect the quality and safety of drinking water in the hamlet.
- Concern regarding direct dumping of sewage. This has occurred on several occasions at the Orangeville plant. The Orangeville sewage plant has had several direct sewage cumps cause by too much water having to be handled, i.e. flooding conditions, and a lengthy and unreported sewage dump when the plant was not being properly maintained.
  - In Erin there could be the possibility of direct dumps due to three causes:
  - 1. Flood conditions causing the plant to have too much water to handle
  - 2. Dry conditions where there is not enough water in the upper credit river to supply to plant
  - Unreported sewage dumps, as took place in Orangeville

This raises many questions, yet to be adequately researched and understood regarding emergency and mitigating measures to prevent pollution of the waterway downstream, preventative measures so that dumping does not occur, cleanup measures in the event a spill and the environmental consequences of a spill when it does occur.

• While the CVC appears to have been involved in the process it is our understanding that the CVC asks to have 10 years of flow measurement data in order to make this type of decision and conclusions, but according to this report it was not available. Is there a plan to secure this data?

- 2.2 Identification and Consideration of the effects of each alternative on all aspects of the environment. The Credit River is a unique and fragile ecosystem that provides clean drinking water to communities along its banks, a home and spawning ground to cold water fish such as Rainbow Trout, Brook Trout, Brown Trout and Chinook salmon. This River is known as "the Crown Jewel of Southern Ontario".
- The Credit River Valley forms the northern limit of the Carolinian Forest Zone and as such is home to
  many species of flora not found in any other part of Canada. The Sassafras Tree and the Tulip Tree are
  two examples. The Valley is strategically placed at the meeting point of the Oak Ridges Moraine and the
  Niagara Escarpment. It is an important source for Lake Ontario and a major migratory corridor from Lake
  Ontario to the interior of the province. It is a unique river in that it has a naturally producing native Brook
  Trout population.

The Credit Valley, supported by this river system, is home to 47 species at risk. Here live vulnerable species such as the Red Shouldered Hawk and the Yellow Breasted Chat. Provincially threatened species such as the Red Sided Dace flourish in the Credit. Nationally threatened species such as Jefferson's Salamander, Least Bittern, Deep Water Sculpin and Henlow's Sparrow make the Credit River Valley their home. It is a waterway of not only provincial significance but also national.

We believe that a higher level of environmental study is called for to clearly understand the impact of a Waste Management system being discharged directly into the Credit River.

Sincerely,

Judy Mabee President Belfountain Community Organization On behalf of the Belfountain Community Organization

July 20, 2018

Judy Mabee

Ministère de l'Environnement, de la Protection de la nature et des Parcs

Direction des évaluations et des permissions environnementales

135, avenue St. Clair Ouest Rez-de-chaussée Toronto ON M4V 1P5 Tél : 416 314-8001 Téléc. : 416 314-8452

President, Belfountain Community Organization

Dear Ms. Mabee:

Thank you for your June 12, 2018 correspondence to the Minister of the Environment, Conservation and Parks in which you request that the Corporation of the Town of Erin (Town) be required to prepare an individual environmental assessment (EA) under the *Environmental Assessment Act* (Act) for the proposed Erin Urban Centre Wastewater Servicing (Project). I am pleased to respond on behalf of the Minister.

It is the understanding of the Ministry of the Environment, Conservation and Parks that the Project is being planned under the Municipal Engineers Association Municipal Class Environmental Assessment (Class EA). The Class EA is an approved planning process that proponents must follow for projects of this type in order to obtain authorization to proceed with the project under the act. Despite this process, the Class EA includes a provision whereby any member of the public who has unresolved concerns with a proposed project can request that the Minister require the proponent of the project to prepare an individual EA. The Minister's requirement to prepare an individual EA is referred to by the Class EA as a Part II Order.

Staff at this ministry will review the issues and concerns you have cited as reasons for which an individual EA should be prepared. Your request will be forwarded to the Town. The Town will be directed to review your request and to provide any Project documentation and other information necessary to assist the ministry in its review of your request. This information will be considered by the Minister when making a decision about the request. Where required, ministry technical staff and staff at other agencies may also review the matter.

On the basis of this review and other matters required to be considered by the Minister under the act, the Minister will make a final decision whether or not to require that an individual EA be prepared by the Town. You will be notified in writing of the Minister's decision once it has been made.

I would like to note that, as with all Part II Order requests, Environmental Assessment and Permissions Branch maintains a public file that is available for viewing by any member of the public upon request. Personal and other information in your letter such as name, address, and telephone number and your concerns with this Project will form a part of the public record on this matter required to be maintained pursuant to section 30 of the act. If you wish this information to be excluded from the public file, this Branch must be advised. Notwithstanding the above, this information may still be obtained by members of the public if the ministry is required to disclose it under the *Freedom of Information and Protection of Privacy Act*.

Thank you for taking the time to share your concerns with this Project.

If you have any questions about the ministry's review of your request, please contact Vivien Yan, Project Evaluator for this Project, directly at 416-314-8358 or at Vivien.Yan@ontario.ca

Yours sincerely,

ustind

Kristina Rudzki Supervisor, Project Review Unit Environmental Assessment and Permissions Branch

|   | Issues and Concerns   | Proponent Response   | Status  |
|---|---|--|---|
| 1 | Principals of Environmental<br>Planning<br>a) Consultation with affected<br>parties | Relevant EA Sections that address the concern:<br>ESR Appendix A delineates the entire Public Consultation process.  | There was no contact<br>with Ms. Mabee during<br>the Class EA process |
| ł | b) Effect on drinking water   | <b>Summary of how the concern has been addressed:</b><br>As outlined in Appendix A of the ESR, a comprehensive list of local residents, Agencies and<br>Indigenous Groups was developed at the initiation of the Class EA. The list of interested<br>parties and local residents was updated throughout the Class EA. This comprehensive list<br>was used for the distribution of all Notices and Communications related to the Class EA, in<br>addition to the publication of the Notices in local newspapers (Erin Advocate and the<br>Wellington Advertiser) along with the Town's website. The list of Agencies, that all Notices<br>and letters were sent too, included the Town of Caledon and the Region of Peel (which the<br>community of Belfountain is within). In response to the multiple Notices throughout the Class<br>EA, no comments were received from the Town of Caledon. The Region of Peel did provide<br>comments on the ESR and (letter dated June 12, 2018, attached) and their only comment is<br>the potential for impact to their Inglewood Well # 2. We are confident that there will be no<br>impact from the proposed Erin wastewater effluent on the Inglewood Well and the Project<br>team will be responding to the Region of Reel shortly. | the Part II Order.  |
|   |   | There was no response from Belfountain residents to the Notice of Project Commencement or to either of the notifications of the two Public Information Centres. Also, no residents of Belfountain or members of the Belfountain Community Organization requested their names to be added to the project contact list.  |   |
|   |   | CVC participated in reviewing all project documentation and in agreeing with the effluent limits for the discharge of treated effluent to the West Credit River. It is recognized by the project team and by CVC and MOECC (now MECP) that the river has a significant fishery resource  |   |

|    | Issues and Concerns  | Proponent Response  | Status |
|----|--|---|--------|
|    |  | and the effluent limits were established to maintain water quality at a level that protects this fishery and downstream water users.  |        |
|    |  | The Assimilative Capacity study (ACS) Section 6.3 of the ESR defines the mixing zone downstream of the effluent discharge at Winston Churchill Boulevard. At the end of this mixing zone, the effluent would have no impact on the river's ability to meet Provincial Water Quality Objectives (PWQO). Notwithstanding the fact that the effluent will not result in an exceedance of a PWQO beyond the mixing zone, the West Credit River represents a surface water source for drinking water and any abstractions from the river for drinking water supplies should include suitable treatment to remove contaminants and pathogens. |        |
|    |  | Relevant consultations with other agencies:   |        |
|    |  | MOECC and CVC representatives formed part of the project Core Management Team and reviewed every aspect of the team's work for compliance with their requirements. Both MOECC and CVC participated in review of the ACS and all comments from these agencies were addressed in the ESR documentation. The Town will confirm their agreement to implement the final comments/recommendations of MOECC and CVC received as part of their final review of the ESR documents.   |        |
| 2. | Direct Dumping of Sewage<br>a) Caused by flood conditions<br>b) Caused by dry conditions in<br>the river<br>c) Unreported sewage dumps | Relevant EA Sections that address the concern:  |        |
|    |  | ESR Section 14.5 (Overflow/Spills Management), page 147, and Appendix S (Spills Risk Management) addresses the potential for spills and recommends mitigation to minimize the risk of a spill.  |        |
|    |  | ESR Section 6.3 (Assimilative Capacity Study) outlines how the effluent limits and objectives were established for the discharge of treated effluent to the West Credit River. This section refers to Appendix D of the ESR which contains the Assimilative Capacity Study (ACS) completed as part of Phase 2 of the Class EA. Appendix B of the ACS, contains a memorandum from CVC which delineates the minimum dry weather flow (7Q20) in the West Credit River to be used in establishing the mixing zone for the proposed discharge to the west credit river.  |        |
|    |  | Summary of how the concern has been addressed:  |        |
|    |  | The issue of spills to the river was raised by both MOECC and CVC who both indicated that the Class EA must delineate a means to reduce the risk of spills. In addition, several members of the public raised the issue during the Public Information Centres.  |        |
|    |  | The Spills Risk Management Technical Memorandum delineates the events that could lead to<br>a potential spill. These range from failures of various components of the system to<br>exceedance of system capacity during storm events. Suggestions are made for component  |        |

| Issues and Concerns              | Proponent Response   | Status |
|----------------------------------|--|--------|
|                                  | redundancy and for design and construction standards to minimize the risk from component failure. Suggestions are also made to ensure that storm events do not result in an exceedance of system capacity over the life of the system. This includes retention of an allowance for inflows and infiltration into the sewers.   |        |
|                                  | The Erin Wastewater System will be a completely new system that will be designed to ensure that the system capacity is never exceeded under storm conditions.  |        |
|                                  | It is unclear what Ms Mabee means by the statement "Dry conditions where there is not<br>enough water in the upper west credit river to supply the plant". The Wastewater Treatment<br>Plant does receive any water from the west credit river. However, the west credit river must<br>have enough flow under dry conditions, to receive the effluent and maintain river water quality<br>at the end of a mixing zone. In this regard, CVC established the dry weather flow to be used<br>in the analysis. The low flow level used in the analysis is referred to as the 7Q20 flow (lowest<br>average flow over 7 days within 20 years). CVC reduced the 7Q20 flow by 10% to allow for<br>climate change effects. Based on the analysis, the mixing zone has been established for the<br>projected worst case flow scenario when the wastewater system is operating at capacity. |        |
|                                  | The ESR indicates how the risk of spills to the river will be minimized. Under the existing Water Resources Act in Ontario, wastewater operating authorities must report all spills of untreated wastewater to surface waters to the MECP.   |        |
|                                  | Relevant consultations with other agencies:  |        |
|                                  | Both MOECC and CVC participated in review of the ACS and all comments from these agencies were addressed in the ESR documentation. Both MOECC and CVC also reviewed the ESR and are in agreement with the location of the outfall and the effluent limits necessary to protect the river.  |        |
| 3. CVC Required 10 years of Data | Relevant EA Sections that address the concern:   |        |
|                                  | This issue is addressed in Appendix B of the ACS which is Appendix D in the ESR.   |        |
|                                  | Summary of how the concern has been addressed:   |        |
|                                  | As noted above, CVC developed a 7Q20 low flow in the river based on their accumulated flow data. The low flow prediction was based on flow measurements at 10th Line combined with the extrapolation of data from 8th Line to achieve the desired level of data. The CVC memorandum was peer reviewed by the project team to confirm the low flow value.   |        |
|                                  | Relevant consultations with other agencies:  |        |
|                                  | Both MOECC and CVC agree with the low flow estimate for the west credit river used in the  |        |

|    | Issues and Concerns                                    | Proponent Response  | Status |
|----|--|---|--------|
|    |  | analysis of the impact of the effluent on the river water quality.  |        |
| 4. | Consideration of Environmental<br>Effects on the River | Relevant EA Sections that address the concern:  |        |
|    |  | ESR Section 14.1 (Natural Environment) and Appendix H (Natural Environment Report) deals with potential impacts to the natural environment as a result of the project for the various components of the proposed wastewater system.   |        |
|    |  | Summary of how the concern has been addressed:  |        |
|    |  | The Natural Environment Report recognizes the west credit river as a fragile ecosystem that supports an important population of brook trout. The potential impacts on the natural environment have been detailed in the report and the effluent criteria for the discharge to the river were developed to protect the environment.  |        |
|    |  | Relevant consultations with other agencies:   |        |
|    |  | Both MOECC and CVC reviewed the ESR and are satisfied with the location of the WWTP, the location of the proposed effluent outfall and the effluent limits for the discharge.   |        |
| 5. | Credit River Valley                                    | Relevant EA Sections that address the concern:  |        |
|    |  | ESR Section 14.1 (Natural Environment) pages 141 - 144 and Appendix H (Natural Environment Report) deals with potential impacts to the natural environment as a result of the project for the various components of the proposed wastewater system.   |        |
|    |  | ESR Section 14.11 (Environmental Management) pages 154 – 155 and Appendix T (Environmental Management Plan) detail mitigation measures proposed to protect the natural environment during construction.   |        |
|    |  | Summary of how the concern has been addressed:  |        |
|    |  | As noted above, the Natural Environment Report recognizes the local ecosystem in the valley of the west credit river. The potential impacts on the natural environment have been detailed in the report and the effluent criteria for the discharge have been developed to protect the environment. Species at risk have been identified in the report. While the project will generate short term impacts on the natural environment through construction, it is unlikely that the project will result in long term impacts to the natural environment. Mitigation to minimize the impact on species at risk has been identified in the ESR. It is suggested that an environmental management plan be developed and implemented prior to construction to ensure that the natural environment is protected. |        |

| Issues and Concerns | Proponent Response   | Status |

#### Re: Comments on Notice of Completion of Environmental Study Report Urban Centre Wastewater Servicing Class Environmental Assessment Town of Erin

Dear Lisa Campion and Joe Mullan:

Region of Peel staff have reviewed the above notice dated May 3, 2018 and have the following comments:

#### Source Water Protection

Regional Staff would like to highlight the source protection vulnerable area near the preferred outfall location (west side of Winston Churchill Blvd.). The attached map shows the Wellhead Protection Area (WHPA-E) for the Region's Well (Inglewood Well No. 2). The study needs to assess the risks from effluent discharges/by-passes to address any impacts of the preferred outfall location as a potential source of pathogens to the supply aquifer for Inglewood Well No. 2. The supply aquifer is considered to be leaky confined to unconfined. A geotechnical/hydrogeological study to assess surface water-groundwater linkages needs to be completed. A spills prevention and contingency plan for the project needs to be completed in accordance with source water protection policies.

#### **Concluding Remarks**

If you have any questions or concerns, please contact me at your earliest convenience at 905-791-7800 ext. 4710, or by email at: wayne.koethe@peelregion.ca

Sincerely,

W. Southo

Wayne Koethe, Development Facilitator, Development Services, Public Works

Enclosed: Wellhead Protection Area & Proposed Outfall Map

Ms. Judy Mabee President Belfountain Community Organization

Dear Ms. Mabee:

Thank you for conveying the Belfountain Community Organization's interest in the Erin Urban Centre Wastewater Servicing Class Environmental Assessment as proposed by the Town of Erin. I welcome the Organization's comments on this project.

On June 13, 2018, you requested that the Town be required to prepare an individual environmental assessment for the Erin Urban Centre Wastewater Servicing Class Environmental Assessment. I am taking this opportunity to inform you that I have decided that elevating the project to an individual environmental assessment is not required.

In making this decision, I have given careful consideration to the project documentation, the provisions of the Municipal Class Environmental Assessment, the issues raised in the requests, and relevant matters to be considered under section 16 of the Environmental Assessment Act.

The Municipal Class Environmental Assessment is a process by which proponents plan and develop projects of this type, including evaluating alternatives, assessing environmental effects, developing mitigation measures, and consulting with the public, without having to obtain approval from me and the Lieutenant Governor in Council for each individual project.

The Municipal Class Environmental Assessment has itself been subject to review and approval under the Act, which determined, in part, that the application of the Municipal Class Environmental Assessment process would enable proponents to meet the intent

Ms. Judy Mabee Page 2.

and purpose of the Act. The Town has demonstrated that it has planned and developed this Project in accordance with the provisions of the Municipal Class Environmental Assessment. I am satisfied therefore that the purpose of the Act, "the betterment of the people of the whole or any part of Ontario by providing for the protection, conservation and wise management in Ontario of the environment," has been met for this project.

The concerns raised, together with the reasons for my decision, are set out in the attached table. I am satisfied that the issues and concerns have been addressed by the work done to date by the Town or will be addressed in future work that is required to be carried out.

With this decision having been made, the Town can now proceed with the project, subject to any other permits or approvals required. The Town must ensure it implements the project in the manner it was developed and designed, as set out in the project documentation, and inclusive of all mitigating measures, and environmental and other provisions therein.

Again, I would like to thank you for participating in the Class Environmental Assessment process and for bringing the Belfountain Community Organization's concerns to my attention.

Sincerely,

Jeff Yurek Minister

c: Lisa Campion, Deputy Clerk, Corporation for the Town of Erin Gary Scott, Senior Project Advisor, Ainley Group EA File No. 18061 – Erin Urban Centre Wastewater Servicing

# Erin Urban Centre Wastewater Servicing – Town of Erin Municipal Class Environmental Assessment

Minister's Review of Issues Raised by Requesters

| Issue   | Response and Analysis  |
|---|--|
| Class Environmental Asse  | ssment Process   |
| Downstream<br>communities were not<br>adequately consulted<br>because of the distance<br>from the proposed<br>project, however,<br>impacts from the project<br>will be realized<br>downstream.  | The Town of Erin followed the requirements of the Municipal<br>Class Environmental Assessment document for<br>consultation, along with guidance from Ministry of<br>Environment, Conservation and Parks.<br>The Town developed a list of local residents, agencies, and<br>Indigenous groups and it was updated throughout the class<br>environmental assessment process. The list of agencies<br>included the Town of Caledon and Region of Peel which are<br>downstream of the project site. The consultation list was<br>used for the distribution of project notices and<br>communications related to the project. The Town also<br>published notices in local newspapers and on the Town's<br>website. Two public information centers were held in 2016<br>and 2018 to provide the public the opportunity to submit<br>comments to be considered in the preparation of the<br>environmental study report. This consultation included the<br>communities located downstream. Concerns about the<br>discharge location, quality of drinking water, and odour<br>impacts were discussed during the consultation requirements<br>of Municipal Class Environmental Assessment. |
| Decentralized plant<br>alternatives (subsurface<br>disposal and a two-<br>treatment plant system)<br>were not considered<br>resulting in an<br>inadequate examination<br>of alternatives.<br>Cost comparisons<br>between a single system<br>solution and<br>decentralized systems | The Municipal Class Environmental Assessment requires<br>that proponents consider alternatives based on existing<br>baseline conditions and identify if alternatives will have a<br>potential impact on the natural, social, and economic<br>environments. Based on feedback from the public<br>consultation process following the Servicing and Settlement<br>Master Plan in 2014, a further examination of servicing<br>options such as subsurface disposal (septic tank) solutions<br>and a two-treatment plant alternative was undertaken.<br>It was determined that subsurface disposal options were<br>limited due to the topography, system of wetlands, source<br>water protection areas, and lack of available land space.  |

| Issue   | Response and Analysis   |
|---|---|
| was not undertaken.   | Credit Valley Conservation has indicated that future<br>development should not include septic systems due to<br>potential cumulative impacts these systems may have on<br>the natural environment and water quality.  |
|   | A two-treatment plant alternative was investigated in the<br>environmental study report. The evaluation examined the<br>feasibility of having a wastewater treatment plant dedicated<br>to Hillsburgh and Erin Village rather than having a single<br>plant servicing both communities. It was determined that<br>costs to build and operate two treatment plants were higher<br>than operating a single plant. The cost difference exceeded<br>the \$5 million required to construct a connection pipe<br>between the two communities to a single treatment plant.   |
|   | two-plant alternative were not viable and as such further<br>cost analysis was not undertaken. The ministry and Credit<br>Valley Conservation reviewed the subsurface disposal and<br>the two-plant alternatives analysis and are in agreement with<br>the conclusions.   |
|   | I am satisfied that the Town fulfilled the alternative evaluation requirements of the Municipal Class Environmental Assessment.   |
| Natural Environment   |   |
| Impacts to river water<br>quality and fish health<br>from chemicals in<br>effluent discharge<br>including chloride and<br>ammonia | The wastewater treatment plant will have to operate under<br>requirements of an environmental compliance approval<br>issued by the ministry that sets strict effluent limits and<br>operating conditions related to chloride, ammonia and other<br>contaminants.  |
|   | Credit Valley Conservation provided recommendations to<br>the Town following the filing of the environmental study<br>report to control the input of chloride at the source. For<br>example, Credit Valley Conservation recommended that<br>agreements for new subdivisions contain conditions<br>requiring high efficiency water softeners for each lot to<br>reduce chloride in wastewater (water softeners are a<br>significant source of chloride). The Town has agreed to<br>implement the comments and recommendations received<br>from Credit Valley Conservation during project<br>implementation. Ministry technical staff and the Ministry of |

| Issue   | Response and Analysis  |
|---|--|
|   | Natural Resources and Forestry support the recommendations provided by Credit Valley Conservation.   |
|   | Ministry technical staff will require the ongoing monitoring of<br>chloride levels in the influent, effluent, and the West Credit<br>River receiving water in the Town's environmental<br>compliance approval. The Town has agreed to the ministry's<br>requirement for ongoing monitoring of chloride levels after<br>the wastewater treatment plant has been constructed. The<br>Ministry of Natural Resources and Forestry and Credit<br>Valley Conservation support the ministry's chloride<br>monitoring condition in the environmental compliance<br>approval.   |
|   | Toxicity of ammonia to fish species was a key factor in<br>Town's development of effluent limits and objectives for<br>effluent discharge to the West Credit River. The proposed<br>criteria for ammonia was selected after analysis and<br>modelling of the receiving water and considering protection<br>of aquatic life. The proposed effluent limits represent a high<br>level of treatment for ammonia at 0.6 milligrams per litre at<br>full build out and remain below the Provincial Water Quality<br>Objective. The ministry and Credit Valley Conservation are<br>satisfied with the proposed effluent limits including ammonia<br>discharge limits. The proposed effluent limits for ammonia<br>will be subject to meeting the requirements under the plant's<br>environmental compliance approval. |
|   | I am satisfied that the Town's proposed effluent limits meet<br>ministry requirements for wastewater treatment operations<br>discharging to surface waters.  |
| Pharmaceuticals and<br>personal care products<br>in effluent discharge will<br>impact hormone systems<br>in fish and their<br>reproductive success. | Pharmaceuticals and personal care products can originate<br>from numerous sources in wastewater effluent. Some<br>pharmaceutical products are endocrine disruptors, some of<br>which have estrogenic properties that can interfere with<br>hormone systems resulting in the feminization of male fish<br>and impacts to fish reproductive success. Ministry technical<br>staff are aware of the potential effects of pharmaceutical<br>compounds and other endocrine disruptors, as this is an<br>active research field.   |
|   | The Ministry of Natural Resources and Forestry<br>recommended that the proposed Erin wastewater treatment<br>plant include higher treatment processes to assist with the<br>removal of pharmaceutical compounds with estrogenic  |

| Issue   | Response and Analysis   |
|---|---|
|   | properties.   |
|   | In recognizing the need to protect an important fish<br>community in the river, the Town chose tertiary treatment as<br>it was necessary to achieve a high quality of effluent. The<br>advanced wastewater treatment process (Membrane<br>Bioreactor) that is being proposed for the treatment plant<br>can generally achieve high removal rates of endocrine<br>disruptors/estrogen compounds compared with conventional<br>wastewater treatment processes.  |
|   | It has been the observation of scientists and engineers,<br>including ministry technical experts, that the higher the level<br>of treatment employed by a wastewater treatment plant, the<br>greater the reduction of pharmaceutical and other<br>compounds in final effluent.  |
|   | I am satisfied that the Town considered measures to reduce<br>impacts associated with pharmaceuticals and personal care<br>products in wastewater effluent.   |
| The effluent discharge<br>mixing zone in the river<br>will create a barrier for<br>fish movement. | No barrier to fish movement is predicted for the discharge<br>outfall. Under the full wastewater treatment plant capacity<br>modelling, the effluent discharge mixing zone will not extend<br>across the full width of the river. Water quality modeling of<br>the effluent mixing zone defined the extent of the plume<br>before the effluent is fully mixed and water quality<br>parameters are below the Provincial Water Quality<br>Objectives for surface waters. The outfall mixing zone would<br>be non-toxic in nature and has been modelled to occupy<br>approximately 40% of the channel width. |
|   | In order to maintain safe passage for fish and avoid the<br>effluent mixing plume to extend over the entire width of the<br>river, the outfall pipe will include multiple openings for better<br>effluent mixing and will be configured parallel to the south<br>bank of the West Credit River. The preferred design<br>minimizes the width of the river which effluent would mix and<br>maintains a larger area outside the zone of mixing allowing<br>for fish to pass along the opposite side of the diffuser.   |
|   | I am satisfied that the Town considered outfall design alternatives to accommodate fish passage.  |
| Direct spills of raw  | The Erin Urban Wastewater Servicing class environmental   |

| Issue   | Response and Analysis   |
|---|---|
| sewage from flood<br>conditions, dry<br>conditions and<br>unreported sewage<br>dumps will pollute the<br>downstream river.  | assessment proposed mitigation and management practices<br>to ensure the protection of the river through flooding and dry<br>conditions. The proposed wastewater system will be a new<br>system designed for peak flows beyond the proposed<br>servicing capacity in accordance with ministry guidelines<br>and to protect the West Credit River. The recommended<br>size of the wastewater system and daily flow rate ensures<br>long-term performance and the avoidance of potential spills.<br>Potential spills are avoided by preventing the capacity of all<br>wastewater system components from exceeding any flow<br>conditions. |
|   | The environmental study report includes an overflow risk<br>management technical memorandum that addresses the<br>potential for spills and mitigation actions to minimize the risk<br>of spill, including inspections and preventative maintenance.<br>Credit Valley Conservation is satisfied and will be consulted<br>during the final design stage of the project on how the<br>mitigation actions will be implemented into the final design.  |
|   | The West Credit River must have enough river flow under<br>dry conditions to receive treated effluent and maintain river<br>water quality. A dry weather low flow model was used for<br>water quality modeling. Based on the water quality modelling<br>and analysis, the effluent discharge location has been<br>assessed for the projected worse case scenario when the<br>wastewater system is operating at full capacity.   |
|   | I am satisfied that adequate design capacity and mitigation measures are proposed to protect the West Credit River from potential spills.   |
| Environmental impacts<br>to the cold-water fishery<br>(Rainbow Trout, Brook<br>Trout, Brown Trout,<br>Chinook Salmon) and<br>species at risk in the<br>Credit River Valley was<br>not adequately<br>considered. | While the project will generate short-term impacts on the<br>natural environment through construction, potential long-<br>term impacts are not expected. Credit Valley Conservation<br>and ministry technical staff reviewed the project<br>documentation and are satisfied with the proposed effluent<br>discharge objectives and limits. Final effluent limits and<br>objectives for treated wastewater discharge will be issued<br>and regulated by the ministry's environmental compliance<br>approval.   |
|   | The environmental study report recognizes the local<br>ecosystem in the valley of the West Credit River that<br>supports an important population of fish and species at risk.<br>Water quality modeling defined effluent objectives and limits  |

| Issue   | Response and Analysis   |
|---|---|
|   | to ensure appropriate treatment was set to meet water<br>quality objectives and protect important cold-water fish<br>species in the river. In addition, a detailed thermal<br>assessment was done to ensure effluent discharge<br>temperatures did not pose a threat to cold-water fish<br>survival, growth and reproduction.   |
|   | Potential impacts to the environment and species as well as<br>mitigation measures are documented in the environmental<br>study report. The proposed mitigation measures include<br>performing construction activities outside of the breeding or<br>spawning season of sensitive species or species at risk and<br>developing an environmental management plan prior to<br>construction. The environmental management plan will<br>further define environmental mitigation and protection<br>measures, establish inspections and monitoring, and provide<br>contingency planning.  |
|   | I am satisfied with the proposed effluent discharge limits and mitigation measures for species at risk.   |
| Project   |   |
| The size of the<br>wastewater facility and<br>proposed wastewater<br>flow rate of 380 litres per<br>person per day is<br>beyond what is needed<br>for population projections<br>and does not align with<br>other communities that<br>are implementing water<br>conservation initiatives.<br>A reduction of the<br>proposed inflow and<br>infiltration rate (90 litres<br>per person) would<br>reduce costs and the<br>size of the facility. | The recommended flow rate is similar or below other<br>adjacent municipalities' design standards. The population<br>projection utilized to estimate full build out in the Town of<br>Erin was identified in the Town's Official Plan and agreed<br>with Wellington County Planning Department. The proposed<br>project is within design parameters to ensure efficient and<br>reliable performance and does not conflict with water<br>conservation initiatives by the Town. The ministry and Credit<br>Valley Conservation reviewed the capacity technical<br>memorandum for compliance with capacity requirements<br>and are in agreement with the sizing of the proposed<br>wastewater system. |
|   | A 380 litres per person per day wastewater flow rate was<br>developed by combining the residential flow rate of 290 litres<br>per person per day and the inflow and infiltration rate<br>(groundwater and stormwater that enter into the wastewater<br>system) of 90 litres per person per day. The proposed<br>wastewater flow rate value was based on actual water<br>usage records from the communities between 2013 and<br>2015 with the addition of a safety factor for water<br>consumption to account for future variations and extra  |

| Issue  | Response and Analysis  |
|--|--|
|  | growth. Extra capacity is an industry standard intended to offset loss of efficiency as the wastewater system ages over an 80-year lifecycle.  |
|  | The 380 litres per person waste flow rate per day falls within the ministry's guidelines for recommended municipal wastewater system flow rates.   |
|  | I am satisfied that the Town has appropriately characterized<br>the wastewater system capacity as part of the Municipal<br>Class Environmental Assessment study.   |
| Operating and<br>maintenance costs<br>should be fully estimated<br>so that long-term<br>economic impacts on the<br>Town and residents are<br>considered. | The Municipal Class Environmental Assessment requires a consideration of the economic impacts of any proposed undertaking that is restricted to capital, operating, and maintenance cost estimations. Government grants pay for infrastructure that services the existing community. Funding is expected to be generated through the development charges that will result from new residential and commercial development approvals in the Town of Erin.   |
|  | Based on public feedback and concerns on the system cost,<br>a capital cost summary report was prepared and included in<br>the environmental study report. The environmental study<br>report outlines the estimated cost of all aspects of the<br>project including capital and operating costs that references<br>user rates from similar and adjacent wastewater facilities.<br>The cost estimate is based on the actual length and depth of<br>sewers, connection pipes, and pumping stations and is<br>considered accurate. Capital and operating cost estimates<br>were based on similar neighbouring wastewater treatment<br>plants as well as quotations obtained from a range of<br>vendors for equipment. |
|  | The capital cost of full development build out is<br>approximated at \$118 million. The cost share between the<br>Town and developers has been identified as between \$50 to<br>\$60 million for the Town, and \$58 to \$68 million for the<br>developers. The Town requires government financing for the<br>project or it cannot proceed.   |
|  | I am satisfied that adequate consideration of economic impacts was provided as per the Municipal Class Environmental Assessment requirements.  |

| Issue  | Response and Analysis  |
|--|--|
| The assimilative capacity<br>study did not have ten<br>years of river flow data<br>required by Credit Valley<br>Conservation Authority<br>for the Town to make<br>adequate project<br>decisions. | The environmental study report includes an assimilative capacity study that modeled the West Credit River's capacity to receive wastewater effluent without damaging water quality and quantity. The Credit River Conservation established a low river flow value for the West Credit River which was used as the design flow for the assimilative capacity modeling. While there was no river flow data for a 10-year period at the preferred effluent discharge site located at 10 <sup>th</sup> Line and Winston Churchill Boulevard, the low flow index was based on accumulated flow data on the same river at two other locations downstream. The data use for the projections was greater than 10 years and was combined with recent flow data at the project location to calculate a flow index. The combined data was approved for the required analysis by the Credit River Conservation and the ministry. |

Wednesday, June 13, 2018

To: Ms. Campion, Mr. Mullan and Ministry of Environment and Climate Change,

Please find this email as a statement of outstanding concern regarding the Town of Erin Urban Wastewater Treatment Plant. I also ask the Minister of Environment and Climate Change to order a change in the project status and ask for a higher level of assessment referred to a Part II order based on following conditions:

### Concerns:

A. Chemical Situations: List of persistent chemicals in the natural environment.

- 1. Chloride from water softeners
- 2. Ammonia from sewage
- 3. Endocrine disruptors; estrogens based compounds from birth control medications resulting in males with physical female characteristics.

### B. Fish Nursery: Barrier of effluent

The CVC determined that there was a significant amount of harm to a section of the West Credit River. This is one of the last cold water fisheries in this part of the world. 150M downstream from the effluent will be unusable for fish. The mixing zone of effluent in the river will create a barrier for fish and completely prevent them from swimming up or down stream. In other words fish above stream will be prevented from swimming downstream and vice versa.

### C. Spills & Fishery

- 1. Situations that cause raw sewage to enter the river from the proposed Erin Sewage treatment Plant. It is questionable that this problem has been adcressed to the level of detail that is required. (Neighbouring Orangeville has unfortunately had raw sewage released a number of times into the Credit River.)
- 2. The above in combination with road salt and farm runo f into the West Credit River is unacceptable. This is the location of one of the last cold water fisheries in this part of the world and it must be protected.

### D. Lack of Consultations with Down Stream Communities:

1. Ainley & Associated Limited did not consult with the Belfountain Community Planning Organization. The Town of Erin did not reach out to downstream communities. There was a lack of consultation regarding urban growth will neighbouring downstream communities.
- 2. Belfountain is 1.2 km downstream of the effluent. Odour from this proposed sewage treatment blows east; directly into our community and the Belfountain Conservation Area. This will have a significant detrimental effect on the tourism industry (Business) and our quality of life. Because Belfountain is downwind from the planned urban sprawl in Erin and its accompanying sewage treatment plant this treasured visitor experience will be jeopardized and thousands of visiting tourists will not experience fresh country air and peace. This in addition to our property values being significantly lowered.
- 3. This proposed wastewater system swells the urban population to 14,600 people in Erin. Urban sprawl creates a low quality of life due to extensive commute times and significantly contributes to the already overburdened roads which Belfountain suffers from today. In addition more sprawl plus more roads and accompanying driving contributes to climate change.
- 4. A pipe is planned to discharge the effluent into the West Credit River downstream directly at the Caledon border (Winston Churchill Boulevard). It is unacceptable to release Erin's effluent at our border and in my back yard.

In conclusion this email is sent to your office to file a Part 2 Order Request with the Ministry of the Environment

for the Proposed Erin Urban Centre Wastewater Servicing: Class Environmental Assessment. Plus a bump-up request to MNR.

To order the Minister of the Environment and Climate Change (MOECC) a change in the project status and require a higher level of assessment under an individual Environmental Assessment process (referred to as a Part II Order).

Thank you for your attention,

Ann Seymour 702 River Road Belfountian, ON L7K 0E5 Ministry of the Environment, Conservation and Parks

Environmental Assessment and Permissions Branch

135 St. Clair Avenue West 1<sup>st</sup> Floor Toronto ON M4V 1P5 Tel.: 416 314-8001 Fax: 416 314-8452

July 20, 2018

Ann Seymour 702 River Road <u>Belfountain ON\_L7K\_</u>0E5

#### Dear Ms. Seymour:

Thank you for your June 13, 2018 correspondence to the Minister of the Environment, Conservation and Parks in which you request that the Corporation of the Town of Erin (Town) be required to prepare an individual environmental assessment (EA) under the *Environmental Assessment Act* (Act) for the proposed Erin Urban Centre Wastewater Servicing (Project). I am pleased to respond on behalf of the Minister.

Ministère de l'Environnement, de

la Protection de la nature et des

Direction des évaluations et des

permissions environnementales

135, avenue St. Clair Ouest

Rez-de-chaussée

Toronto ON M4V 1P5

Tél: 416 314-8001

Téléc. : 416 314-8452

Parcs

It is the understanding of the Ministry of the Environment, Conservation and Parks that the Project is being planned under the Municipal Engineers Association Municipal Class Environmental Assessment (Class EA). The Class EA is an approved planning process that proponents must follow for projects of this type in order to obtain authorization to proceed with the project under the act. Despite this process, the Class EA includes a provision whereby any member of the public who has unresolved concerns with a proposed project can request that the Minister require the proponent of the project to prepare an individual EA. The Minister's requirement to prepare an individual EA is referred to by the Class EA as a Part II Order.

Staff at this ministry will review the issues and concerns you have cited as reasons for which an individual EA should be prepared. Your request will be forwarded to the Town. The Town will be directed to review your request and to provide any Project documentation and other information necessary to assist the ministry in its review of your request. This information will be considered by the Minister when making a decision about the request. Where required, ministry technical staff and staff at other agencies may also review the matter.

On the basis of this review and other matters required to be considered by the Minister under the act, the Minister will make a final decision whether or not to require that an individual EA be prepared by the Town. You will be notified in writing of the Minister's decision once it has been made.

I would like to note that, as with all Part II Order requests, Environmental Assessment and Permissions Branch maintains a public file that is available for viewing by any member of the public upon request. Personal and other information in your letter such as name, address, and telephone number and your concerns with this Project will form a part of the public record on this matter required to be maintained pursuant to section 30 of the act. If you wish this information to be excluded from the public file, this Branch must be advised. Notwithstanding the above, this information may still be obtained by members of the public if the ministry is required to disclose it under the *Freedom of Information and Protection of Privacy Act*.

Thank you for taking the time to share your concerns with this Project.

If you have any questions about the ministry's review of your request, please contact Vivien Yan, Project Evaluator for this Project, directly at 416-314-8358 or at Vivien.Yan@ontario.ca

Yours sincerely,

C:

|    |  | The issue of chloride levels in the effluent is addressed in the ACS.   |  |
|    | Th<br>eff<br>ob<br>Th<br>ES<br>Su<br>Bo<br>the<br>Th<br>the<br>eff<br>of<br>To                   | The toxicity of ammonia to fish is well established and was a key factor in developing the effluent limits and objectives for the discharge to the West Credit River. The effluent limits and objectives for ammonia are also outlined in the ACS.  | Effluent Limits and<br>Objectives for the<br>treated wastewater                      |
|    |  | The issue of endocrine disruptors/estrogen compounds is addressed in Section 14.10 of the ESR under the heading "Pharmaceuticals".  | discharge will be<br>issued by MECP during<br>the future ECA                         |
|    |  | Summary of how the concern has been addressed:  | process.   |
|    |  | Both MOECC and CVC expressed concern regarding the potential chloride concentrations in the effluent. MOECC required a survey of fresh water mussel species sensitive to chlorides. The field survey did not identify any of these species of concern in the reach downstream of the discharge. As a result, MOECC indicated that they do not foresee the need to impose an effluent limit for chlorides in the future ECA; however, they would require ongoing monitoring of chloride levels, after the Wastewater Treatment Plant has been constructed, which the Town is agreeable with. |  |
|    |  | CVC provided their final comments on the ESR in their letter June 27, 2018 (see attached). In   |  |

| Issues and Concerns         | Proponent Response   | Status |
|-----------------------------|--|--------|
|                             | this letter CVC addressed the issue of chlorides and they made several recommendations to the Town to address the issue. Also, the MOECC in their June 14, 2018 letter (see attached), provided comments on the final ESR and outlined their support for the CVC comments on Chlorides. The Town is agreeable to implement the CVC recommendations during project implementation. Please note that these letters were received after the ESR was published and therefore they are not currently within the ESR, but they will be incorporated in conjunction with the resolution to the Part II Orders.  |        |
|                             | The proposed effluent limits represent a high level of treatment for ammonia removal to minimize the impact zone for fish. The water quality modeling completed as part of the ACS recommended an effluent limit for Ammonia and this was reviewed by MOECC and CVC and found to be acceptable. Through review of the ACS, MOECC and CVC did not raise any issues regarding the proposed ammonia discharge limits.   |        |
|                             | The issue of endocrine disruptors/estrogen compounds did not arise during the Class EA process until receipt of the Part II Order by the Ms. Seymour; however, it is recognized as an issue of concern to the public in general and was therefore addressed in the ESR (Section 14.10 (Pharmaceuticals). In recognizing the need to protect an important fish community in the river, it was necessary to achieve a very high quality of effluent. The advanced wastewater treatment process (Membrane Bioreactor (MBR) that is being proposed for Erin can generally achieve high removal rates of endocrine disruptors/estrogen compounds compared with conventional wastewater treatment processes. |        |
|                             | Relevant consultations with other agencies:  |        |
|                             | As noted above, MOECC and CVC representatives formed part of the project Core<br>Management Team and reviewed every aspect of the team's work for compliance with their<br>requirements. Both MOECC and CVC participated in review of the ACS and all comments<br>from these agencies were addressed in the ESR documentation. Also, the Town agrees to<br>implement the comments/recommendations that have been received from the MOECC and<br>CVC.   |        |
| B. Fish Nursery             | Relevant EA Sections that address the concern:   |        |
| 1. Darrier to fish movement | ESR Section 6.3 (Assimilative Capacity Study), pages 26 – 29, outlines how the effluent limits and objectives were established for the discharge of treated effluent to the West Credit River. This section refers to Appendix D of the ESR which contains the Assimilative Capacity Study (ACS) completed as part of Phase 2 of the Class EA and modified to incorporate the comments of Ministry of Environment and Climate Change (MOECC) and the Credit Valley Conservation (CVC).   |        |
|                             | ESR Section 13.3 (WWTP Effluent Outfall Location evaluation), pages 96 - 104, and  |        |

|    | Issues and Concerns   | Proponent Response   | Status |
|----|---|--|--------|
|    |   | Appendix P (Effluent Outfall Site Selection Technical memorandum) outline how the outfall location was selected and summarizes the potential environmental impacts.  |        |
|    |   | Summary of how the concern has been addressed:   |        |
|    |   | Hydraulic modeling of the mixing zone downstream of the effluent discharge delineates the extent of the plume before the effluent is fully mixed and water quality parameters are below Provincial Water Quality Objectives for surface waters. In order to maintain safe passage for fish and avoid the plume extending over the entire width of the river, a multiport outfall structure is recommended to be configured along one bank of the river. The Provincial Water Quality Objective for Ammonia would be reached 153 m downstream from the outfall under full build out flow and under the 7Q20 flow in the river and the plume will not extend across the full width of the river. In addition, the effluent ammonia level at the point of discharge will meet the requirement for non-lethality, under the full build out and 7Q20 flow scenario. |        |
|    |   | The lowest summer flow (7Q20) was established by CVC and includes a reduction of 10% to account for climate change.  |        |
|    |   | The Winston Churchill Boulevard location was selected because there is a higher base flow at this location, lower water temperature, better mixing opportunity and potentially less impact on brook trout. A conceptual design for the outfall was illustrated to ensure the outfall meets the requirements for mixing delineated in the ACS.  |        |
|    |   | Relevant consultations with other agencies:  |        |
|    |   | Both MOECC and CVC participated in review of the ACS and all comments from these agencies were addressed and incorporated into the ESR. Both MOECC and CVC also reviewed the ESR and are in agreement with the location of the outfall and the effluent limits necessary to protect the river.   |        |
| C. | Spills and Fishery  | Relevant EA Sections that address the concern:   |        |
|    | 1 Spills Potential not<br>Adequately Addressed                        | ESR Section 14.5 (Overflow/Spills Management), page 147, and Appendix S (Spills Risk Management) addresses the potential for spills and recommend mitigation to minimize the rick of a spill   |        |
|    | 2 Effluent combined with road<br>salt and farm runoff<br>unacceptable | Road salt can contribute chlorides to surface waters. Road salt was not a consideration during this Class EA except that existing background chloride levels in the West Credit River were used in the study.  |        |
|    |   | Summary of how the concern has been addressed:   |        |
|    |   | The issue of spills to the river was raised by both MOECC and CVC who both indicated that the Class EA must delineate a means to reduce the risk of spills. In addition, several   |        |

| Issues and Concerns   | Proponent Response  | Status |
|---|---|--------|
|   | members of the public raised the issue during the Public Information Centres.   |        |
|   | The Spills Risk Management Technical Memorandum delineates the events that could lead to<br>a potential spill. These range from failures of various components of the system to<br>exceedance of system capacity during storm events. Suggestions are made for component<br>redundancy and for design and construction standards to minimize the risk from component<br>failure. Suggestions are also made to ensure that storm events do not result in an<br>exceedance of system capacity over the life of the system.  |        |
|   | Relevant consultations with other agencies:   |        |
|   | Both the MOECC and CVC reviewed the Spills Risk Management and are satisfied with the recommendations aimed at minimizing the risk of a spill occurrence.   |        |
| D. Lack of Consultation with  | Relevant EA Sections that address the concern:  |        |
| 1. No consultation with   | ESR Appendix A delineates the entire Public Consultation process.   |        |
| Bellfountain Community<br>Organisation<br>2. Odour Impact on<br>Downstream Communities              | ESR Section 14.6 (Odour) deals with Odour Management for the various components of the proposed wastewater system. Pages 147 – 150, address the types and potential sources of odour from the proposed wastewater system as well as identifying mitigation measures for control of odours   |        |
| <ul> <li>Bellfountain Roads</li> <li>4. Location of Discharge at<br/>Erin Caledon Border</li> </ul> | ESR Section 6.2 (System Capacity and Sewage Flows) page 23 and Appendix C delineate the extent of the proposed wastewater system to service the existing population and growth based on the existing Town of Erin Official Plan as approved by the County of Wellington.  |        |
|   | The issue of Growth impact on Bellfountain Roads (or any other roads) was not addressed within this Class EA. This would be the subject of a separate planning study.   |        |
|   | ESR Section 13.3 (WWTP Effluent Outfall Location evaluation), pages 96 – 104, and Appendix P (Effluent Outfall Site Selection Technical memorandum) outline how the outfall location was selected.  |        |
|   | Summary of how the concern has been addressed:  |        |
|   | The first contact with Ms. Seymour was during Public Information Centre (PIC) No. 2 on February 2, 2018. At that time Ms. Seymour approached our Project team members and discussed her concerns, primarily related to the impacts of the Wastewater discharge on the river and Bellfountain residents. During the PIC No. 2 attendees were encouraged to submit formal comments (either using the Comments Sheets provided or by Email) on any of the materials that was presented, such that all comments could be taken into consideration prior to preparation of the ESR. Subsequent, to the PIC No. 2, Ms. Seymour did not submit any |        |

| Issues and Concerns | Proponent Response  | Status |
|---------------------|---|--------|
|                     | comments or have any further contact with the Project team until the submission of the Request for a Part II Order after the ESR was filed.   |        |
|                     | As outlined in Appendix A of the ESR, a comprehensive list of local residents, Agencies and Indigenous Groups was developed at the initiation of the Class EA. The list of interested parties and local residents was updated throughout the Class EA. This comprehensive list was used for the distribution of all Notices and Communications related to the Class EA, in addition to the publication of the Notices in local newspapers (Erin Advocate and the Wellington Advertiser) along with the Town's website. The list of Agencies, that all Notices and letters were sent too, included the Town of Caledon and the Region of Peel (which the community of Belfountain is within). In response to the multiple Notices throughout the Class EA, no comments were received from the Town of Caledon. The Region of Peel did provide comments on the ESR and (letter dated June 12, 2018, attached) and their only comment is the potential for impact to their Inglewood Well # 2. We are confident that there will be no impact from the proposed Erin wastewater effluent on the Inglewood Well and the Project team will be responding to the Region of Reel shortly. |        |
|                     | CVC participated in reviewing all project documentation and in agreeing with the effluent limits for the discharge of treated effluent to the West Credit River. It is recognized by the project team and by CVC and MOECC (now MECP) that the river has a significant fishery resource and the effluent limits were established to maintain water quality at a level that protects this fishery and downstream water users.  |        |
|                     | The location of the WWTP is in compliance with MOECC Guideline D2 which sets minimum separation distances between wastewater treatment plants and critical receptors. In addition, odour control measures are suggested sufficient to meet the threshold of 1 odour unit at the property boundary of the wastewater treatment plant site. Odour control mitigation has been illustrated in the plant layout and has been costed into the cost estimate (\$3.5 million). The odour control measures will be part of the ECA application.   |        |
|                     | It is extremely unlikely residents of Caledon will experience any odour from the WWTP site.<br>The Town of Caledon boundary is 1.5 km from the plant site. Bellfountain is over 3 km from<br>the site.  |        |
|                     | The issue of growth is a concern that has been expressed by several members of the public during the Class EA process. The answer to these concerns is that the Town intends to complete an Official Plan Review following completion of the Wastewater Servicing Class EA to delineate the extent and type of growth in the two urban areas of Hillsburgh and Erin Village. Section 21 (Implementation and Staging Considerations) of the ESR indicates that the Town is also completing a Water Supply Class EA in parallel with the Wastewater Class EA. The Town then intends to complete an Official Plan Review based on the recommendations from these critical infrastructure components. Transportation planning will form part of the   |        |

| Issues and Concerns | Proponent Response  | Status |
|---------------------|---|--------|
|                     | Official Plan Review.   |        |
|                     | The outfall location was selected as described in item B above.   |        |
|                     | Relevant consultations with other agencies:   |        |
|                     | Both MOECC and CVC reviewed the ESR and are satisfied with the location of the WWTP, suggested odour mitigation, and the location of the proposed effluent outfall. |        |

June 27, 2018

Ainley Group 195 County Court Blvd., Suite 300 Brampton, Ontario L6W 4P7

Attention: Preya Balgobin, P.Eng Senior Project Manager

Re: Town of Erin Urban Centre Wastewater Serving Schedule C EA

CVC has reviewed the Environmental Study Report (ESR) for the Town of Erin Urban Centre Wastewater Servicing Class Environmental Assessment (Ainley, April 2018); Response to CVC Comments on Project Supporting Studies (Ainley, April 10, 2018) and Response to CVC letter (Ainley, June 14, 2018).

CVC has no objection to the approval of the ESR and find the response comments to our previous concerns satisfactory; however, we provide the following comments for your consideration during future phases of the project including detail design.

#### **Ontario Regulation 162/06**

Portions of the project (outfail, a number of sewage pumping stations, some of the sewers) are within regulated areas and as result are subject to the Development, Interference with Wetlands, and Alterations to Shorelines & Watercourses Regulation (CVC Ontarlo Regulation 160/06). This regulation prohibits altering a watercourse, wetland or shoreline and prohibits development in areas adjacent to the Lake Ontario shoreline, river and stream valleys, hazardous lands and wetlands, without the prior written approval of CVC (i.e. the issuance of a permit).

With respect to the sewage pumping stations, although typically essential services should be located outside the natural hazards, recognizing that pump stations need to be located at low elevations, CVC finds it acceptable in principle that the pump stations are located within the flood plain subject to the hazard being minimized and are adequately addressed through detail design including, locating in the area of least hazard, floodproofing of structures, improved back-up systems and providing suitable access during Regional Storm conditions. However, CVC does not support the location of essential infrastructure within the erosion hazard.

It should be noted that the preferred location of H-SPS 2 is within the erosion hazard of the West Credit River. CVC does not support this location. By relocating the station to the north side of Mill Street the pump station would be outside the erosion hazard. In addition H-SPS 2 is subject to approximately 1.44 metres of flooding during Regional Storm conditions. This is beyond the typical floodproofing depths and as a result special design considerations are going to be required during detail design. Options need to be considered ....2/

to relocate H-SPS 2 to outside the floodplain or at minimum to an area of less flooding.

E-SPS 1 and E-SPS also appear to be within the floodplain; however, they would be subject to less flooding that can be more readily addressed during detail design including relocating outside of the floodplain or to area of least flooding.

#### West Credit Assimilative Capacity Study Final - December 2017

CVC still has concerns about the potential impacts of exceeding chronic chloride water quality guidelines at full build out flows.

We would just like to reiterate that the results show that under full build out effluent flows instream chloride concentrations will exceed aquatic guidelines for chronic exposure. At the present time, it is not technically feasible to remove chloride in the treatment process; therefore the emphasis should be placed in controlling the input of chloride at the source. It is recognized that water softeners are a significant source of chloride/salts in the wastewater stream specifically in areas on groundwater drinking water supply.

In order to minimize the impacts to aquatic life including brook trout, CVC has the following recommendations for the Town of Erin to be addressed in the future:

- New Developments: That the subdivision agreements for new subdivisions contain conditions that require the installation of high efficiency water softeners for each lot.
- Existing Developments: That the Town of Erin consider funding available to private residents to upgrade plumbing infrastructure on private property to tie into the new sewer lines. It is recommended that the installation of high efficiency water softeners be part of the plumbing upgrades included in the funding model.
- Education Program: That the Town of Erin consider providing continuous education to Erin residents during the implementation of new wastewater servicing in the Town. CVC can provide information in different media formats on how residents can minimize their environmental impacts on their own property including the installation of high efficiency water softeners

#### **Thermal Impact Assessment**

CVC has no objection to the proposed outfall location at Winston Churchill Boulevard. Based on the available data this location presents the least potential impact to the aquatic community out of the 3 potential sites proposed in the ESR.

For a variety of reasons, the existing stream temperatures in the West Credit River at the proposed discharge location are already warmer than preferred. To reduce the possibility of warming of the watercourse further, as part of detail design, opportunities to cool the discharge should be reviewed.

....3/

#### **Overflow Risk Management**

CVC is satisfied with the overflow risk management technical memorandum including the differentiation of potential causes of spill and bypasses and specific mitigation measure for each type. CVC agrees that management inspections and preventative maintenance is key to the long term management of wastewater spills risks to the West Credit watershed.

CVC would like further details in the final design stage of this project on how the mitigation actions recommended in the overflow risk management memo will be implemented into final design (e.g. duel pumps, twin power, flow logger with alarms) stormwater and sanitary operations (regular inspection and maintenance programs) and in policy (sewer use by-law, spill response plan).

#### Conclusion

As stated above, CVC as no objection to the approval of the ESR. CVC would like to participate in future phases in the project including Site Plan and CVC Permitting, ECA permits, and development of monitoring plans (including temperature, nitrate).

CVC would also be willing to participate in any future meetings that our related to our areas of concern.

Do not hesitate to contact the undersigned if you have any additional questions.

Yours truly,

Liam Marray Senior Manager Planning Ecology

## Re: MOECC Comments on the Town of Erin Urban Centre Wastewater Servicing Class EA

The ministry's involvement with the Town of Erin has a long project history starting with the BM Ross Settlement and Servicing Master Plan. Accordingly, our familiarity with the project is well-established. Similarly, staff at the district and regional levels maintained a close working relationship with the project team in light of our dual role of ensuring the integrity of the environmental assessment process, and our role of environmental protection and eventual approval of the proposed wastewater treatment plant.

This focused our review of the ESR to the issues of environmental assessment process and technical issues that require resolution to enable the next phases of detailed design and eventual application for approval.

# Issues Specific to protection of water resources and subsequent approvals:

- With respect to assimilative capacity and outfall selection, we are satisfied that the ESR has included effluent criteria, thermal assessment on brook trout and chloride monitoring that have been agreed upon during previous discussions and reviews;
- We have reviewed the spills risk management plan that has been included as an appendix to the ESR and we conceptually agree with the proposal. We recognize that this is more suited to the role of the Review Engineer;
- We support the CVC in its encouragement that all efforts be taken by the Town to investigate and implement at-source chloride minimization (from the use of water softeners);
- We recognize that details as to outfall design and monitoring of influent, effluent and receiving waters will be finalized at the permitting stage; and
- Once all outstanding issues have been resolved, the inclusion of this letter as part of the supporting documentation for the OWRA approval should negate the need for the Approvals Engineer to engage in lengthy consultation with this office provided

that the supporting documentation replicates that which has already been agreed upon.

## Issues specific to the environmental assessment process;

 It is noted that 3 indigenous communities were notified of this project along with notices for all of the PICs. However, having reviewed the ESR, I was not able to find any correspondence from any of the indigenous communities to show whether they had any concerns. Please note that if there has been no response from these communities, the Town should make further attempts to contact these communities to obtain written confirmation that they do not have concerns with the project, or if they do have concerns, the manner in which the Town intends to address them.

## Issues raised by the Ministry of Natural Resources and Forestry:

MNRF has expressed many concerns with the manner in which the outfall location
was chosen and about the assumptions and methodology used in the assimilative
capacity determination due to concerns as to the impacts to brook trout and their
spawning habitat. It is our expectation that the consultants will provide additional
information/response to these concerns.

Given the shared interests, MOECC is also prepared to participate in any meetings that may be convened to address MNRF's concerns.

This concludes our comments. Should you have any questions, please do not hesitate to contact me either by phone at (905) 521-7864 or via email at <u>Barbara.slattery@ontario.ca</u>.

#### Re: Comments on Notice of Completion of Environmental Study Report Urban Centre Wastewater Servicing Class Environmental Assessment Town of Erin

Dear Lisa Campion and Joe Mullan:

Region of Peel staff have reviewed the above notice dated May 3, 2018 and have the following comments:

#### Source Water Protection

Regional Staff would like to highlight the source protection vulnerable area near the preferred outfall location (west side of Winston Churchill Blvd.). The attached map shows the Wellhead Protection Area (WHPA-E) for the Region's Well (Inglewood Well No. 2). The study needs to assess the risks from effluent discharges/by-passes to address any impacts of the preferred outfall location as a potential source of pathogens to the supply aquifer for Inglewood Well No. 2. The supply aquifer is considered to be leaky confined to unconfined. A geotechnical/hydrogeological study to assess surface water-groundwater linkages needs to be completed. A spills prevention and contingency plan for the project needs to be completed in accordance with source water protection policies.

#### **Concluding Remarks**

If you have any questions or concerns, please contact me at your earliest convenience at 905-791-7800 ext. 4710, or by email at: wayne.koethe@peelregion.ca

Sincerely,

W. Southo

Wayne Koethe, Development Facilitator, Development Services, Public Works

AUG 2 9 2019

Ms. Ann Seymour 702 River Road Belfountain ON\_L7K 0E5

Dear Ms. Seymour:

Thank you for your interest in the Erin Urban Centre Wastewater Servicing Class Environmental Assessment as proposed by the Town of Erin. I welcome your comments on this project.

On June 15, 2018, you requested that the Town be required to prepare an individual environmental assessment for the Erin Urban Centre Wastewater Servicing Class Environmental Assessment. I am taking this opportunity to inform you that I have decided that elevating the project to an individual environmental assessment is not required.

In making this decision, I have given careful consideration to the project documentation, the provisions of the Municipal Class Environmental Assessment, the issues raised in the requests, and relevant matters to be considered under section 16 of the Environmental Assessment Act.

The Municipal Class Environmental Assessment is a process by which proponents plan and develop projects of this type, including evaluating alternatives, assessing environmental effects, developing mitigation measures, and consulting with the public, without having to obtain approval from me and the Lieutenant Governor in Council for each individual project.

The Municipal Class Environmental Assessment has itself been subject to review and approval under the Act, which determined, in part, that the application of the Municipal Class Environmental Assessment process would enable proponents to meet the intent Ms. Ann Seymour Page 2.

and purpose of the Act. The Town has demonstrated that it has planned and developed this Project in accordance with the provisions of the Municipal Class Environmental Assessment. I am satisfied therefore that the purpose of the Act, "the betterment of the people of the whole or any part of Ontario by providing for the protection, conservation and wise management in Ontario of the environment," has been met for this project.

The concerns raised, together with the reasons for my decision, are set out in the attached table. I am satisfied that the issues and concerns have been addressed by the work done to date by the Town or will be addressed in future work that is required to be carried out.

With this decision having been made, the Town can now proceed with the project, subject to any other permits or approvals required. The Town must ensure it implements the project in the manner it was developed and designed, as set out in the project documentation, and inclusive of all mitigating measures, and environmental and other provisions therein.

Again, I would like to thank you for participating in the Class Environmental Assessment process and for bringing your concerns to my attention.

Sincerely,

Jeff Yurek Minister

# Erin Urban Centre Wastewater Servicing – Town of Erin Municipal Class Environmental Assessment

Minister's Review of Issues Raised by Requesters

| Issue   | Response and Analysis  |
|---|--|
| Class Environmental Assessment Process  |  |
| Downstream<br>communities were not<br>adequately consulted<br>because of the distance<br>from the proposed<br>project, however,<br>impacts from the project<br>will be realized<br>downstream.  | The Town of Erin followed the requirements of the Municipal<br>Class Environmental Assessment document for<br>consultation, along with guidance from Ministry of<br>Environment, Conservation and Parks.<br>The Town developed a list of local residents, agencies, and<br>Indigenous groups and it was updated throughout the class<br>environmental assessment process. The list of agencies<br>included the Town of Caledon and Region of Peel which are<br>downstream of the project site. The consultation list was<br>used for the distribution of project notices and<br>communications related to the project. The Town also<br>published notices in local newspapers and on the Town's<br>website. Two public information centers were held in 2016<br>and 2018 to provide the public the opportunity to submit<br>comments to be considered in the preparation of the<br>environmental study report. This consultation included the<br>communities located downstream. Concerns about the<br>discharge location, quality of drinking water, and odour<br>impacts were discussed during the consultation requirements<br>of Municipal Class Environmental Assessment. |
| Decentralized plant<br>alternatives (subsurface<br>disposal and a two-<br>treatment plant system)<br>were not considered<br>resulting in an<br>inadequate examination<br>of alternatives.<br>Cost comparisons<br>between a single system<br>solution and<br>decentralized systems | The Municipal Class Environmental Assessment requires<br>that proponents consider alternatives based on existing<br>baseline conditions and identify if alternatives will have a<br>potential impact on the natural, social, and economic<br>environments. Based on feedback from the public<br>consultation process following the Servicing and Settlement<br>Master Plan in 2014, a further examination of servicing<br>options such as subsurface disposal (septic tank) solutions<br>and a two-treatment plant alternative was undertaken.<br>It was determined that subsurface disposal options were<br>limited due to the topography, system of wetlands, source<br>water protection areas, and lack of available land space.  |

| Issue  | Response and Analysis   |
|--|---|
| was not undertaken.  | Credit Valley Conservation has indicated that future<br>development should not include septic systems due to<br>potential cumulative impacts these systems may have on<br>the natural environment and water quality.  |
|  | A two-treatment plant alternative was investigated in the<br>environmental study report. The evaluation examined the<br>feasibility of having a wastewater treatment plant dedicated<br>to Hillsburgh and Erin Village rather than having a single<br>plant servicing both communities. It was determined that<br>costs to build and operate two treatment plants were higher<br>than operating a single plant. The cost difference exceeded<br>the \$5 million required to construct a connection pipe<br>between the two communities to a single treatment plant.   |
|  | two-plant alternative were not viable and as such further<br>cost analysis was not undertaken. The ministry and Credit<br>Valley Conservation reviewed the subsurface disposal and<br>the two-plant alternatives analysis and are in agreement with<br>the conclusions.   |
|  | I am satisfied that the Town fulfilled the alternative evaluation requirements of the Municipal Class Environmental Assessment.   |
| Natural Environment  |   |
| Impacts to river water<br>quality and fish health<br>from chemicals in<br>effluent discharge<br>including chloride and | The wastewater treatment plant will have to operate under<br>requirements of an environmental compliance approval<br>issued by the ministry that sets strict effluent limits and<br>operating conditions related to chloride, ammonia and other<br>contaminants.  |
|  | Credit Valley Conservation provided recommendations to<br>the Town following the filing of the environmental study<br>report to control the input of chloride at the source. For<br>example, Credit Valley Conservation recommended that<br>agreements for new subdivisions contain conditions<br>requiring high efficiency water softeners for each lot to<br>reduce chloride in wastewater (water softeners are a<br>significant source of chloride). The Town has agreed to<br>implement the comments and recommendations received<br>from Credit Valley Conservation during project<br>implementation. Ministry technical staff and the Ministry of |

| Issue   | Response and Analysis  |
|---|--|
|   | Natural Resources and Forestry support the recommendations provided by Credit Valley Conservation.   |
|   | Ministry technical staff will require the ongoing monitoring of<br>chloride levels in the influent, effluent, and the West Credit<br>River receiving water in the Town's environmental<br>compliance approval. The Town has agreed to the ministry's<br>requirement for ongoing monitoring of chloride levels after<br>the wastewater treatment plant has been constructed. The<br>Ministry of Natural Resources and Forestry and Credit<br>Valley Conservation support the ministry's chloride<br>monitoring condition in the environmental compliance<br>approval.   |
|   | Toxicity of ammonia to fish species was a key factor in<br>Town's development of effluent limits and objectives for<br>effluent discharge to the West Credit River. The proposed<br>criteria for ammonia was selected after analysis and<br>modelling of the receiving water and considering protection<br>of aquatic life. The proposed effluent limits represent a high<br>level of treatment for ammonia at 0.6 milligrams per litre at<br>full build out and remain below the Provincial Water Quality<br>Objective. The ministry and Credit Valley Conservation are<br>satisfied with the proposed effluent limits including ammonia<br>discharge limits. The proposed effluent limits for ammonia<br>will be subject to meeting the requirements under the plant's<br>environmental compliance approval. |
|   | I am satisfied that the Town's proposed effluent limits meet<br>ministry requirements for wastewater treatment operations<br>discharging to surface waters.  |
| Pharmaceuticals and<br>personal care products<br>in effluent discharge will<br>impact hormone systems<br>in fish and their<br>reproductive success. | Pharmaceuticals and personal care products can originate<br>from numerous sources in wastewater effluent. Some<br>pharmaceutical products are endocrine disruptors, some of<br>which have estrogenic properties that can interfere with<br>hormone systems resulting in the feminization of male fish<br>and impacts to fish reproductive success. Ministry technical<br>staff are aware of the potential effects of pharmaceutical<br>compounds and other endocrine disruptors, as this is an<br>active research field.   |
|   | The Ministry of Natural Resources and Forestry<br>recommended that the proposed Erin wastewater treatment<br>plant include higher treatment processes to assist with the<br>removal of pharmaceutical compounds with estrogenic  |

| Issue   | Response and Analysis   |
|---|---|
|   | properties.   |
|   | In recognizing the need to protect an important fish<br>community in the river, the Town chose tertiary treatment as<br>it was necessary to achieve a high quality of effluent. The<br>advanced wastewater treatment process (Membrane<br>Bioreactor) that is being proposed for the treatment plant<br>can generally achieve high removal rates of endocrine<br>disruptors/estrogen compounds compared with conventional<br>wastewater treatment processes.  |
|   | It has been the observation of scientists and engineers,<br>including ministry technical experts, that the higher the level<br>of treatment employed by a wastewater treatment plant, the<br>greater the reduction of pharmaceutical and other<br>compounds in final effluent.  |
|   | I am satisfied that the Town considered measures to reduce<br>impacts associated with pharmaceuticals and personal care<br>products in wastewater effluent.   |
| The effluent discharge<br>mixing zone in the river<br>will create a barrier for<br>fish movement. | No barrier to fish movement is predicted for the discharge<br>outfall. Under the full wastewater treatment plant capacity<br>modelling, the effluent discharge mixing zone will not extend<br>across the full width of the river. Water quality modeling of<br>the effluent mixing zone defined the extent of the plume<br>before the effluent is fully mixed and water quality<br>parameters are below the Provincial Water Quality<br>Objectives for surface waters. The outfall mixing zone would<br>be non-toxic in nature and has been modelled to occupy<br>approximately 40% of the channel width. |
|   | In order to maintain safe passage for fish and avoid the<br>effluent mixing plume to extend over the entire width of the<br>river, the outfall pipe will include multiple openings for better<br>effluent mixing and will be configured parallel to the south<br>bank of the West Credit River. The preferred design<br>minimizes the width of the river which effluent would mix and<br>maintains a larger area outside the zone of mixing allowing<br>for fish to pass along the opposite side of the diffuser.   |
|   | I am satisfied that the Town considered outfall design alternatives to accommodate fish passage.  |
| Direct spills of raw  | The Erin Urban Wastewater Servicing class environmental   |

| Issue   | Response and Analysis   |
|---|---|
| sewage from flood<br>conditions, dry<br>conditions and<br>unreported sewage<br>dumps will pollute the<br>downstream river.  | assessment proposed mitigation and management practices<br>to ensure the protection of the river through flooding and dry<br>conditions. The proposed wastewater system will be a new<br>system designed for peak flows beyond the proposed<br>servicing capacity in accordance with ministry guidelines<br>and to protect the West Credit River. The recommended<br>size of the wastewater system and daily flow rate ensures<br>long-term performance and the avoidance of potential spills.<br>Potential spills are avoided by preventing the capacity of all<br>wastewater system components from exceeding any flow<br>conditions. |
|   | The environmental study report includes an overflow risk<br>management technical memorandum that addresses the<br>potential for spills and mitigation actions to minimize the risk<br>of spill, including inspections and preventative maintenance.<br>Credit Valley Conservation is satisfied and will be consulted<br>during the final design stage of the project on how the<br>mitigation actions will be implemented into the final design.  |
|   | The West Credit River must have enough river flow under<br>dry conditions to receive treated effluent and maintain river<br>water quality. A dry weather low flow model was used for<br>water quality modeling. Based on the water quality modelling<br>and analysis, the effluent discharge location has been<br>assessed for the projected worse case scenario when the<br>wastewater system is operating at full capacity.   |
|   | I am satisfied that adequate design capacity and mitigation measures are proposed to protect the West Credit River from potential spills.   |
| Environmental impacts<br>to the cold-water fishery<br>(Rainbow Trout, Brook<br>Trout, Brown Trout,<br>Chinook Salmon) and<br>species at risk in the<br>Credit River Valley was<br>not adequately<br>considered. | While the project will generate short-term impacts on the<br>natural environment through construction, potential long-<br>term impacts are not expected. Credit Valley Conservation<br>and ministry technical staff reviewed the project<br>documentation and are satisfied with the proposed effluent<br>discharge objectives and limits. Final effluent limits and<br>objectives for treated wastewater discharge will be issued<br>and regulated by the ministry's environmental compliance<br>approval.   |
|   | The environmental study report recognizes the local<br>ecosystem in the valley of the West Credit River that<br>supports an important population of fish and species at risk.<br>Water quality modeling defined effluent objectives and limits  |

| Issue  | Response and Analysis   |
|--|---|
|  | to ensure appropriate treatment was set to meet water<br>quality objectives and protect important cold-water fish<br>species in the river. In addition, a detailed thermal<br>assessment was done to ensure effluent discharge<br>temperatures did not pose a threat to cold-water fish<br>survival, growth and reproduction.   |
|  | Potential impacts to the environment and species as well as<br>mitigation measures are documented in the environmental<br>study report. The proposed mitigation measures include<br>performing construction activities outside of the breeding or<br>spawning season of sensitive species or species at risk and<br>developing an environmental management plan prior to<br>construction. The environmental management plan will<br>further define environmental mitigation and protection<br>measures, establish inspections and monitoring, and provide<br>contingency planning.  |
|  | I am satisfied with the proposed effluent discharge limits and mitigation measures for species at risk.   |
| Project  |   |
| The size of the<br>wastewater facility and<br>proposed wastewater<br>flow rate of 380 litres per<br>person per day is<br>beyond what is needed<br>for population projections<br>and does not align with<br>other communities that<br>are implementing water<br>conservation initiatives. | The recommended flow rate is similar or below other<br>adjacent municipalities' design standards. The population<br>projection utilized to estimate full build out in the Town of<br>Erin was identified in the Town's Official Plan and agreed<br>with Wellington County Planning Department. The proposed<br>project is within design parameters to ensure efficient and<br>reliable performance and does not conflict with water<br>conservation initiatives by the Town. The ministry and Credit<br>Valley Conservation reviewed the capacity technical<br>memorandum for compliance with capacity requirements<br>and are in agreement with the sizing of the proposed<br>wastewater system. |
| proposed inflow and<br>infiltration rate (90 litres<br>per person) would<br>reduce costs and the<br>size of the facility.  | A 380 litres per person per day wastewater flow rate was<br>developed by combining the residential flow rate of 290 litres<br>per person per day and the inflow and infiltration rate<br>(groundwater and stormwater that enter into the wastewater<br>system) of 90 litres per person per day. The proposed<br>wastewater flow rate value was based on actual water<br>usage records from the communities between 2013 and<br>2015 with the addition of a safety factor for water<br>consumption to account for future variations and extra  |

| Issue  | Response and Analysis  |
|--|--|
|  | growth. Extra capacity is an industry standard intended to offset loss of efficiency as the wastewater system ages over an 80-year lifecycle.  |
|  | The 380 litres per person waste flow rate per day falls within the ministry's guidelines for recommended municipal wastewater system flow rates.   |
|  | I am satisfied that the Town has appropriately characterized<br>the wastewater system capacity as part of the Municipal<br>Class Environmental Assessment study.   |
| Operating and<br>maintenance costs<br>should be fully estimated<br>so that long-term<br>economic impacts on the<br>Town and residents are<br>considered. | The Municipal Class Environmental Assessment requires a<br>consideration of the economic impacts of any proposed<br>indertaking that is restricted to capital, operating, and<br>maintenance cost estimations. Government grants pay for<br>infrastructure that services the existing community. Funding<br>a expected to be generated through the development<br>charges that will result from new residential and commercial<br>levelopment approvals in the Town of Erin.   |
|  | Based on public feedback and concerns on the system cost,<br>a capital cost summary report was prepared and included in<br>the environmental study report. The environmental study<br>report outlines the estimated cost of all aspects of the<br>project including capital and operating costs that references<br>user rates from similar and adjacent wastewater facilities.<br>The cost estimate is based on the actual length and depth of<br>sewers, connection pipes, and pumping stations and is<br>considered accurate. Capital and operating cost estimates<br>were based on similar neighbouring wastewater treatment<br>plants as well as quotations obtained from a range of<br>vendors for equipment. |
|  | The capital cost of full development build out is<br>approximated at \$118 million. The cost share between the<br>Town and developers has been identified as between \$50 to<br>\$60 million for the Town, and \$58 to \$68 million for the<br>developers. The Town requires government financing for the<br>project or it cannot proceed.   |
|  | I am satisfied that adequate consideration of economic impacts was provided as per the Municipal Class Environmental Assessment requirements.  |

| Issue  | Response and Analysis  |
|--|--|
| The assimilative capacity<br>study did not have ten<br>years of river flow data<br>required by Credit Valley<br>Conservation Authority<br>for the Town to make<br>adequate project<br>decisions. | The environmental study report includes an assimilative capacity study that modeled the West Credit River's capacity to receive wastewater effluent without damaging water quality and quantity. The Credit River Conservation established a low river flow value for the West Credit River which was used as the design flow for the assimilative capacity modeling. While there was no river flow data for a 10-year period at the preferred effluent discharge site located at 10 <sup>th</sup> Line and Winston Churchill Boulevard, the low flow index was based on accumulated flow data on the same river at two other locations downstream. The data use for the projections was greater than 10 years and was combined with recent flow data at the project location to calculate a flow index. The combined data was approved for the required analysis by the Credit River Conservation and the ministry. |

# Minister of Environment & Climate Change

Part II Order Request

Urban Centre Wastewater Servicing Class Environmental Assessment, Town of Erin

#### Minister of Environment & Climate Change

77 Wellesley Street West 11<sup>th</sup> Floor Ferguson Block Toronto ON M7A 2T5

#### Environment Approvals Branch Ministry of Environment & Climate Change 135 St. Clair Avenue West

1<sup>st</sup> Floor Toronto ON M4P 1V5 Via email: MOECCpermissions@ontario.ca

#### Lise Campion Deputy Clerk Corporation of the Town of Erin 5684 Trafalgar Road Hillsburgh ON NOB 1Z0 Hand delivered

#### To all recipients:

As a concerned citizen of the Town of Erin, I am requesting a Part II Order to examine issues that I believe have not been adequately addressed in the Urban Centre Wasterwater Servicing Class Environmental Assessment for our municipality, recently completed by Ainley & Associates.

#### These include:

1. Failure to adequately address water conservation issues.

2. Total Cost, including Financial Asset Management issues.

3. Inadequate examination of alternative options.

#### 1. Failure to adequately address water conservation water issues.

The design flow of the proposed wastewater treatment system for the Town of Erin is 380 litres per capita per day, 'in line with industry practice' as Ainley states in justification of this chosen lpcd rate. Given current water use of 160 lpcd (Ainley's figures) in urban centres of the Town, this is an extraordinarily high design flow rate when water-conscious municipalities virtually everywhere are aiming to reduce per capita consumption, and apply conservation constraints that will in turn reduce infrastructure costs. (Even if the average lpcd is 195 litres per day, the recorded water use per person in Erin from 2013-2015, the Ainley lcpd design flow volume is nearly double that amount.)

When questioned about this high flow rate, Ainley recommended to Town Council in January 2018 that it be maintained at 380 lcpd. Hence, the Town treatment system will potentially have capacity well above what is needed for population projections, which include a possible growth trajectory to 14,600 residents in 20 to 30 years' time (over three

1

times the current urban centre population of 4,500.) Ainley has stated this will give Erin flexibility for several future revisions of the Official Plan, but this proposed overbuilding of the system now is resulting in estimated costs our municipality (and its citizens) simply cannot bear without significant government and developers' grants.

The I&I (inflow and infiltration) rate of the proposed wastewater flow is calculated by Ainley to be 90 lcpd. I am aware this is an MOECC design guideline but given improvements in wastewaters system efficiencies, better collection technology and improved surveillance of water/wastewater flows, why is this so high in the year 2018? Reduction or elimination of I&I would have a significant impact on the volumes of wastewater to be treated, and thus the proposed plant's size and cost.

The Town of Erin's comparatively high cost of treated water – \$3.99 per cubic meter, well above Guelph's \$1.72 cu m and Centre Wellington's \$2.44 – may be a blessing in this era of rapidly unfolding water and climate challenges. Ontarians have historically believed that fresh water is in inexhaustible supply in this province, but this is not reality in 2018 (if it ever was).

Guelph, the largest municipality in Canada totally reliant on limited groundwater to supply its burgeoning population, has put in place aggressive long-term reduction targets. Its *Water Efficiency Strategy* is paying big dividends: The City of Guelph spent \$10.2 million on water conservation programs from 2006 to 2015 including comprehensive community education and engagement programs, and saved \$40.6 million on water and wastewater infrastructure during the same period. Per capita residential water use is now at 167 litres per person per day, a 12 percent drop since 2006, and 40 litres less than the average Ontarian. <u>https://gueloh.ca/plans-and-strategies/water-efficiency-strategy/2016-wesu-final-summary-report/</u>

The relatively high cost of water in the Town of Erin may be driving our current 160 - 195 lpcd residential use, but imagine if conservation were at the forefront of the municipality's water policies. A subsidized water reduction program in the Town would result in both lower use and less expensive water bills – and less costly wastewater infrastructure.

A major focus to make our community truly 'future ready' would be to develop and implement effective water conservation education and incentive programs for the existing urban areas. Any new residential development in the Town should feature mandatory water conservation measures that exceed provincial standards, with elements such as greywater capture, treatment and reuse offered as options/incentives to environmentally concerned and cost-conscious homebuyers. Water conservation issues are not the focus of Ainley's Wastewater EA, but they should be the first order of business for the Town, as implementing best practices for water will reduce the need for wastewater capacity.

The maximum population growth to be allowed in the urban centres is tied to the assimilative capacity of the West Credit River, the aforementioned 14,600 residents. This growth will not occur overnight, and surely any proposed treatment plant should be scalable to accommodate this reasonably gradual development over a period of 20-30 years. Why is such excess reserve capacity as endorsed by Ainley needed the day the plant is commissioned?

### 2. Total Cost, including Financial Asset Management issues

Even if developers' and/or government grants cover much of the estimated \$118 million cost of the proposed wastewater system, once commissioned, the Town of Erin will be responsible for overseeing the operation and maintenance of the system in perpetuity, and

2

thus its full replacement cost. With more stringent asset management regulations now in place in Ontario, all users need to understand the long-term financial implications for such the large and spread-out system as described by Ainley in the EA. Therefore, hard questions should be asked about this legacy project for our Town and its residents (and future residents), and answered thoroughly and shared before the EA is approved by MOECC.

Operating expenses should be fully estimated so that residents/taxpayers in the Town of Erin know what it is going to cost them year over year going forward (in addition to hook-up costs), including mideterm technology upgrades and replacements. From experienced professionals, I understand the same system will not operate for decades without modifications and breakdowns. Manufacturers should be able to provide input to Ainley on this matter prior to final approval.

As for Ainley's estimated cost of \$118 million for the total system, numerous wastewater experts have said this estimate is beyond excessive. What they say is needed is a competitive design-build option as opposed to Ainley's design-bid-build option. And there are other possibilities than design-build, including design-build-operate or design-build-finance-operate strategies. These various options should be performancebased, competitive bids that guarantee all components of the system function properly, and consistently achieve the stringent effluent requirements for the receiving stream. These options have the potential to bring the cost down to a more manageable level for smaller municipalities such as Town of Erin.

## 3. Inadequate examination of alternative options.

In January 2017, Town of Erin Council authorized Ainley to proceed with a 'scope of work change' to the Environmental Assessment, as a result of meetings and a request by the local group Transition Erin, and the Public Liaison Committee for the EA. The scope of work change was described as follows: to complete a Class EA Phase 2 Assessment on the viability of utilizing decentralized wastewater treatment plants with subsurface disposal for wastewater servicing within the Town of Erin urban centres. The additional cost for this report by Ainley was \$30,000.

In media reports about this expanded scoping was a reference that – if approved - this project would become the largest subsurface disposal system in the province. Yet when Transition Erin representatives met on December 16, 2016 with Town of Erin and Ainley officials to seek the scope of work change, subsurface options weren't envisioned as the only decentralized system possibility. In fact, limiting the scope to subsurface options would almost certainly guarantee that everything studied under the additional scoping would be unfeasible. Needless to say, Ainley subsequently reported that subsurface disposal was not achievable in the Town's proposed wastewater system.

In response to this report, the Environment and Sustainability Committee of the Town of Erin sent these comments and questions to Ainley in late February 2017.

We believe our Council and Ainley need to be looking at multiple cluster systems – decentralized alternatives to a single, centralized wastewater treatment system for the Town of Erin, and not just shifting the final discharge from the river to a subsurface leaching bed (or beds).

Multiple cluster systems do not exclude surface discharge options. According to Waterloo BioFilter, the technology does exist to use small cluster systems that discharge to surface water, as well as subsurface. Evidence shows these systems

3

can have very high levels of treatment, with enhanced nitrogen, phosphorus, and disinfection, all without chemical addition and the associated maintenance issues.

Hence, before you complete and submit your findings on this scope of work change to Council, we would kindly request answers to these questions in your report:

1) Identify each of the decentralized systems you studied as part of this expanded EA scoping, and comment on why each is or is not suitable to be part or all of the Town of Erin's preferred waste water treatment solution. Have you taken a risk-based approach,-including climate change as a significant factor affecting future infrastructure?

2) Compare the 'cost per connection' for new/existing residences, subdivisions and commercial establishments in the Town of Erin to a single communal system (and its variations) to the cost per connection for decentralized systems such as options offered by Waterloo Biofilter.

3) What is the full lifecycle cost of building/operating a communal sewage treatment plant compared to decentralized options? The current Ainley review probably requires a thorough technical memo for a further look at decentralized options and cost-effective phased growth options. In the end, it would help Council and the public if this were presented as *comparative* life-cycle costs, and ensure that any vendors named are permitted to see the document.

Ainley claimed, in a response letter delivered to this correspondent in November 2017, that these issues had been dealt with in previous reports, including the scope of work change that erroneously restricted its focus to subsurface disposal options. I believe this merely served as an uncomplicated way for Ainley to default to the 'preferred' but costlier solution of gravity fed sewers and a centralized wastewater treatment plant.

In conclusion, I believe all of these issues need to be examined or reexamined prior to MOECC acceptance of the Urban Centre Wastewater Servicing Class Environmental Assessment for the Town of Erin.

Thank you.

Sincerely,

Liz Armstrong Box 430, 5216 Ninth Line Erin ON NOB 1TO

Ministry of the Environment, Conservation and Parks

Environmental Assessment and Permissions Branch

135 St. Clair Avenue West 1<sup>st</sup> Floor Toronto ON M4V 1P5 Tel.: 416 314-8001 Fax: 416 314-8452

July 20, 2018

Liz Armstrong Box 430 Erin ON N0B 1L0 Ministère de l'Environnement, de la Protection de la nature et des Parcs

Direction des évaluations et des permissions environnementales

135, avenue St. Clair Ouest Rez-de-chaussée Toronto ON M4V 1P5 Tél : 416 314-8001 Téléc. : 416 314-8452

#### Dear Ms. Armstrong:

Thank you for your June 13, 2018 correspondence to the Minister of the Environment, Conservation and Parks in which you request that the Corporation of the Town of Erin (Town) be required to prepare an individual environmental assessment (EA) under the *Environmental Assessment Act* (Act) for the proposed Erin Urban Centre Wastewater Servicing (Project). I am pleased to respond on behalf of the Minister.

It is the understanding of the Ministry of the Environment, Conservation and Parks that the Project is being planned under the Municipal Engineers Association Municipal Class Environmental Assessment (Class EA). The Class EA is an approved planning process that proponents must follow for projects of this type in order to obtain authorization to proceed with the project under the act. Despite this process, the Class EA includes a provision whereby any member of the public who has unresolved concerns with a proposed project can request that the Minister require the proponent of the project to prepare an individual EA. The Minister's requirement to prepare an individual EA is referred to by the Class EA as a Part II Order.

Staff at this ministry will review the issues and concerns you have cited as reasons for which an individual EA should be prepared. Your request will be forwarded to the Town. The Town will be directed to review your request and to provide any Project documentation and other information necessary to assist the ministry in its review of your request. This information will be considered by the Minister when making a decision about the request. Where required, ministry technical staff and staff at other agencies may also review the matter.

On the basis of this review and other matters required to be considered by the Minister under the act, the Minister will make a final decision whether or not to require that an individual EA be prepared by the Town. You will be notified in writing of the Minister's decision once it has been made.

I would like to note that, as with all Part II Order requests, Environmental Assessment and Permissions Branch maintains a public file that is available for viewing by any member of the public upon request. Personal and other information in your letter such as name, address, and telephone number and your concerns with this Project will form a part of the public record on this matter required to be maintained pursuant to section 30 of the act. If you wish this information to be excluded from the public file, this Branch must be advised. Notwithstanding the above, this information may still be obtained by members of the public if the ministry is required to disclose it under the *Freedom of Information and Protection of Privacy Act*.

Thank you for taking the time to share your concerns with this Project.

If you have any questions about the ministry's review of your request, please contact Vivien Yan, Project Evaluator for this Project, directly at 416-314-8358 or at Vivien.Yan@ontario.ca

Yours sincerely,

Kristina Rudzki Supervisor, Project Review Unit Environmental Assessment and Permissions Branch

c: Lisa Campion, Deputy Clerk Corporation of the Town of Erin

> Joe Mullan P. Eng. Ainley & Associates Limited

EA File No. 18061 Erin Urban Centre Wastewater Servicing

## **ARMSTRONG PART II ORDER RESPONSE**

## **ARMSTRONG PART II ORDER RESPONSE**

| Issues and Concerns | Proponent Response  | Status |
|---------------------|---|--------|
|                     | basements apartments within existing and new homes, both of which could increase the amount of wastewater being generated per house.  |        |
|                     | Please note that this question and our response is documented in the PIC No. 1 Consultation Report which is included in the ESR (Appendix A).   |        |
|                     | The system capacity issue was also brought forward to Town Council by Ms. Armstrong, at the January 9, 2018 Council Meeting. In response to this request Ainley was specially asked to provide a formal response to the Town relating to the proposed per capita flow rates. Ainley submitted a letter and technical information to Council dated January 19, 2018 which provided a detailed assessment of the proposed per capita flow rates, along with a recommendation not to change the proposed values. This letter and technical information was discussed and subsequently approved by Council. The letter is a public document that was referred to in a response to Ms. Armstrong. The Ainley Letter to Council is attached to this response. |        |
|                     | Following PIC # 2 on February 2, 2018, Ms. Armstrong submitted additional comments to the project team and a response letter was sent to Ms. Armstrong on April 3, 2018. One of the comments again addressed the issue of design capacity. The response letter is included in Appendix A of the ESR and is attached to this response.   |        |
|                     | The Class EA team believes that the responses provided to Ms. Armstrong adequately deal with the issue of system capacity.  |        |
|                     | In addition to the responses provided directly to Ms. Armstrong, ESR Section 14.5 (Overflow/Spills Management) and Appendix S (Spills Risk Management) addresses the potential for a sewage spill to the West Credit River, which is a sensitive receiving stream. Within this section it is identified that the most important consideration in avoiding potential spills is to prevent the capacity of all system components from ever being exceeded under any flow condition, including storm events. It is therefore important to ensure the system has adequate capacity to protect the river.  |        |
|                     | It is also noted that, of the 30 km of sewer identified for the service area, some 23 km are 200 mm sewers which is the minimum recommended sewer size. Adopting a reduced capacity would have no effect on the size of most of the sewers.   |        |
|                     | The preferred alternative identified in the ESR is not in conflict with conservation or any initiatives by the Town to implement water conservation measures. It is important to distinguish between infrastructure design parameters that have been adopted to ensure efficient and reliable long term performance, and the most efficient use of the system throughout its lifespan. All infrastructure components are designed with a factor of safety against failure.  |        |
|                     | The ESR does not identify a capacity for the first Phase of project implementation. A two   |        |

|---|--|--------|
|   | present value in order to compare alternatives.  |        |
|   | Summary of how the concern has been addressed:   |        |
|   | The capital cost estimate was based on typical Ontario construction costs for pipes and similar pumping stations and treatment plants. Quotations were obtained from a range of vendors for equipment. The cost estimate is based on the actual recommended alternative solution including a tertiary treatment plant meeting stringent effluent limits. The capital cost estimate is also based on the actual length and depth of sewers, forcemains and pumping stations and takes into account ground conditions established in a geotechnical report. Allowance was made for engineering and contingencies. It is considered that the cost estimate is as accurate as possible based on the conceptual design outlined in the ESR. |        |
|   | Estimated operating costs were established through comparison with similar adjacent wastewater systems operating under all relevant Ontario regulations including full cost recovery built into user rates.  |        |
|   | Adequate consideration of implementation methods (eg Design and Build) has been provided<br>in the ESR documentation given that the project is still in the planning stage. The actual<br>implementation method will be determined at the implementation stage.  |        |
|   | Relevant consultations with other agencies:  |        |
|   | Relevant agencies were consulted throughout the Class EA process and reviewed all of the project documentation. None of the agencies who reviewed the materials commented on the issue of cost.  |        |
| 3. Inadequate Examination of  | Relevant EA Sections that address the concern:   |        |
| <ul> <li>Alternative Options</li> <li>a) Ainley did not fully address<br/>a decentralized alternative<br/>using multiple cluster<br/>systems</li> <li>b) Identify decentralized<br/>systems that were looked at<br/>including risk based</li> </ul> | The Servicing and Settlement Master Plan (SSMP) completed Phase 1 and Phase 2 of the Class EA process. The recommended preferred general alternative solution identified within the SSMP was a single communal wastewater treatment system servicing both Erin Village and Hillsburgh discharging to a single wastewater treatment plant located to the south of Erin Village with an outfall to the West Credit River between 10 <sup>th</sup> Line and Winston Churchill Boulevard. The Terms of Reference for Phase 3 and Phase 4 of the Class were based on this preferred general alternative presented by the SSMP.  |        |
| approach and climate<br>change<br>c) Compare costs between<br>single solution and   | Section 6 of the ESR addresses refinements to the SSMP including an overview and update<br>of Phase 1 and Phase 2 of the Class EA process. |--|--|
| solution" (one plant servicing Hillsburgh and one plant servicing Erin Village) had not been adequately addressed. These issues were addressed in Section 6.4 and Appendix E of the ESR (Two Treatment Plant Solution) and Section 6.5 and Appendix F of the ESR (Subsurface Disposal Alternative)   |  |
| Summary of how the concern has been addressed:   |  |
| Ms. Armstrong met with the Town and Ainley on December 16, 2016 and requested that the Town investigate the viability of utilizing decentralized wastewater treatment plants based on multiple cluster systems. During this meeting it was pointed out that the opportunities for disposal of effluent would be limited and require a high level of treatment before disposal. Ainley undertook to examine the potential for this and reported to Council by letter dated January 10, 2017.  |  |
| In reviewing the work completed to date Ainley considered that the alternatives for "surface disposal" had been thoroughly reviewed during the SSMP, however the opportunities for "subsurface disposal" had not been fully investigated and it was recommended that the opportunities for subsurface disposal for a range of treatment plant solutions, be more fully explored. As a result, Ainley completed the Subsurface disposal Alternative Technical Memorandum (included in ESR Appendix F). Based on the results of this study it was identified that opportunities for subsurface disposal within the study area, were limited and this especially applied to small systems servicing multiple cluster systems due to the undulating topography, extensive system of wetlands, and lack of available land. It was concluded that the preferred alternative identified in the SSMP remained valid. |  |
| The Subsurface Disposal Technical Memorandum establishes that subsurface disposal does<br>not provide a viable alternative for the study area. As such it was not considered appropriate<br>to cost this alternative or prepare a lifecycle cost analysis for comparison with the single plant<br>alternative.   |  |
| In addition to the Subsurface Disposal Technical Memorandum, Council requested Ainley to investigate a two treatment plant alternative with one plant in Hillsburgh and one plant in Erin Village with surface water discharges to the West Credit River. Ainley outlined their plan to deal with this in their letter of January 10, 2017 (see attached). As a result, Ainley completed the Two Plants Alternative (included in ESR Appendix E). This alternative confirmed that it would be more costly to build and operate two treatment plants than the single system proposed within the SSMP. It also identified the issues involved in establishing effluent criteria for a discharge to the river within Hillsburgh where no flow or quality data has been collected to support an assimilative capacity study.   |  |
|  | Proponent Response solution" (one plant servicing Hillsburgh and one plant servicing Erin Village) had not been adequately addressed. Attn: Christine Furlong P.Eng, Project Manager

# Ref: Town of Erin Urban Centre Wastewater Servicing, Class Environmental Assessment Phases 3 and 4 Potential Scope Change Dealing with "Multiple Plant Solutions"

Dear Ms. Furlong:

We are writing to address a potential scope change to the above-noted project to investigate a solution using "subsurface disposal" from multiple wastewater treatment systems for the Erin and Hillsburgh study area.

## Overview

On December 16, 2016 the Town, Triton and Ainley met with Transition Erin representatives. The meeting had been requested by Transition Erin to discuss the subject of multiple plant solutions for the Town of Erin Urban Centre Wastewater Servicing Class EA Study, rather than a single plant solution discharging treated effluent to the West Credit River downstream of Erin. This issue had been raised at the PLC meeting of November 24, 2016 during which at least two of the PLC members expressed the opinion that they thought a multiple plant solution was to be evaluated during this phase of the project. The project team indicated at the PLC meeting that this was not the case and that the project was moving forward based on the Servicing and Settlement Master Plan (SSMP) solution based on a single plant and that, treatment alternatives for this plant would be established and evaluated during Phase 3 and 4 of the Class EA.

The SSMP and the terms of reference for Phase 3 and 4 of the Class EA study clearly illustrate that the Class EA study is moving forward based on a single plant solution for the entire Erin and Hillsburgh study area with the plant being located downstream of Erin Village and discharging treated effluent to the West Credit River (see extracts attached). The SSMP also looked at various general alternative solutions including pumping effluent to adjacent Municipalities and established that the preferred solution, based on discussion with approval authorities and an evaluation of flows and water quality in the West Credit River, is a single plant solution with a surface water discharge to the river downstream of the Erin urban area. We are confident that, for disposal of treated wastewater effluent to "surface water" sources, the SSMP identifies the preferred alternative and that multiple plants discharging to surface water, were eliminated from further consideration based on water quality considerations in the West Credit River.

Following appointment to Phase 3 and 4 of the Class EA study in March 2016, Ainley has proceeded to complete the Class EA based on the alternative solution for wastewater for both communities as delineated in the SSMP. It should also be noted that the Ministry of Environment and Climate Change (MOECC) and Credit Valley Conservation (CVC), who are the two main approval authorities for the study, were involved in, and approved, the single plant solution with a surface water discharge. Both of these agencies have remained involved in Phase 3 and 4 of the Class EA and are presently reviewing the updated Assimilative Capacity Study (ACS) based on a single plant solution discharging treated wastewater to the West Credit River between 10<sup>th</sup> Line and Winston Churchill Boulevard. We wish to note that the Terms of Reference for the current study also include a requirement to investigate subsurface disposal for a single wastewater treatment plant (WWTP) located generally to the south of Erin Village.

During the December 16, 2016 meeting with Transition Erin, the representatives indicated (by way of a vendor presentation) that multiple, simplified treatment systems discharging to "subsurface" disposal fields, could potentially provide a more cost effective solution. Following this meeting, the Town asked Ainley to advise them whether this alternative should be looked at as part of the Phase 3 and 4 Class EA.

The prime goal of the wastewater component of the SSMP was the elimination of problems associated with private septic systems, including the contamination of groundwater and adjacent surface waters. The SSMP did not examine subsurface disposal alternatives for either a single plant or multiple plants, however, the SSMP did outline the process that would have to be undertaken to consider a subsurface discharge in Phase 3 of the Class EA as outlined in Section 6.3.3 of the SSMP (see extract attached) for a single WWTP. As noted earlier, the Terms of Reference for the current project includes a requirement to evaluate subsurface disposal from a single WWTP located generally to the south of Erin Village. Given that the current project does not include the evaluation of multiple/decentralized treatment plants with subsurface disposal, a project scope change is required to examine this alternative and we outline our approach to the issue below.

# Approach to Decentralized Treatment with Subsurface Disposal

The SSMP did not evaluate the alternative of subsurface disposal as part of Phase 2 of the Class EA. In addition, it should also be recognized that the revised Assimilative Capacity Study (ACS) and capacity assessment completed in 2016 as part of this project, indicates a substantially larger capacity and service population than what was proposed in the 2014 SSMP. Accordingly, we suggest that the alternative of subsurface disposal be evaluated based on the results of the latest assimilative capacity assessment with consideration being given to subsurface disposal as a solution for the existing community and to meet the needs of growth.

We recommend a phased approach wherein we first take a step back and address this alternative at the conceptual/viability level as a Class EA Phase 2 activity and report back to Council with a recommendation whether to further evaluate the alternative as a Phase 3 and 4 activity.

# **Evaluate Conceptual Viability of Decentralized Treatment/Subsurface Disposal (Phase 2 Class EA)** We propose the following:

- Document regulations and likely effluent standards for treatment and subsurface disposal
- Meet with MOECC and CVC to confirm applicable regulations and potential effluent standards for treatment and subsurface disposal

- Perform hydrogeological/geotechnical overview of study area based on existing knowledge, studies, etc. (no field work) to determine water table conditions, general flow direction, vulnerability of the underlying aquifer etc.
- Determine background water quality, if available, of local shallow groundwater to aid in determining potential treatment requirements
- Identify opportunities for treatment and subsurface disposal for existing Erin and Hillsburgh communities and for growth areas
- Identify likely service areas, treatment requirements and size disposal fields for each decentralized system
- Identify land requirements and environmental constraints (wetlands, surface waters, source water protection areas, areas of high aquifer vulnerability, etc.)
- Identify conceptual level capital and operating costs for subsurface disposal alternatives
- Determine whether any treatment/subsurface disposal opportunities represent viable and cost effective alternatives to surface water discharge
- Identify scope, cost and time implications to include treatment/subsurface disposal alternatives in Phase 3 and 4 of the Class EA study
- Develop and present draft report to CMT
- Present final report to CMT and Council

This work can be undertaken within four weeks commencing immediately upon approval including meeting with the CMT and presentation to Council at the first opportunity thereafter. We will undertake this work for \$26,500 (excl HST).

In the meantime, our opinion is that the planned January PIC should be delayed until this matter is evaluated. Following completion of this work, we suggest that an additional PLC meeting be held to confirm the preferred solution(s) to be evaluated during Phase 3 and 4. The cost of this additional PLC meeting is \$5,000 (excl HST).

While undertaking this additional work, our team will continue to work on other aspects of the current project scope such that we can limit potential delays to the project schedule. Should this additional work determine that subsurface disposal does not present a viable alternative then Phase 3 and 4 would proceed as scheduled without any significant delay. However, should subsurface disposal alternatives prove to be viable then we can anticipate a considerable additional cost to complete the necessary fieldwork (as outlined in Section 6.3.3 of the SSMP) and likely an extensive delay to complete the project.

Should you require any additional information, please do not hesitate to contact us.

Yours truly

# AINLEY & ASSOCIATES LIMITED

#### Attn: Ms. Christine Furlong, P.Eng.

#### Ref: Town of Erin Class Environmental Assessment Phase 3 and 4 Per Capita Flows for Wastewater System

Dear Christine:

At the January 9, 2018 Council meeting, a question was asked in relation to the per capita wastewater flow (wastewater flow allowance per person) that we are utilizing to size the proposed Wastewater Treatment Plant and associated collection system. In particular, it was noted that the per capita flows may be too high and as such Council requested that we provide details on the impacts (financial versus risks) associated with using a lower per capita flow rate. Therefore, we provide the following background information along with options and a recommendation for the Town's consideration moving forward.

#### Background

When designing a Wastewater Treatment Plant and the associated collection system one of the first items is to determine the wastewater flows that will be generated by the following three main areas:

- i. Residential users
- ii. Inflow/Infiltration
- iii. Commercial/Industrial properties.

For the residential users, we utilize an industry standard procedure of the determination how many homes (existing & future) will be connected to the collection system and multiplied by the average number of persons per house (2.8 based upon information obtained from Wellington County Planning Department) and then applying an "anticipated" residential flow per person (per capita flow). The Ministry of the Environment and Climate Change (MOECC) who are the approval authority in relation to the Wastewater Treatment Plants and collection systems produce Guidelines that recommend per capita flow allowance of between 225 on 450 litres/person/day (L/p/d).

When B.M. Ross completed the SSMP in 2014 they utilized a residential per capita flow of 345 L/p/d plus an inflow and infiltration (I/I) rate of 90 L/p/d for a total of 435 L/p/d.

# Current Urban Centres Class EA

During Phase 2 of the project, Ainley developed a recommended sewage flow and system capacity. This work was documented in a Technical Memorandum dated November 2016 and this memorandum was part of the materials presented through the Public information Centre (PIC) in June 2017. Within this Technical Memorandum we have developed a residential per capita flow of 290 L/p/d plus an inflow and infiltration rate of 90 L/p/d for a total of 380 L/p/d. The development of this per capita flow allowance was based upon the following:

- Average water consumption in the communities between 2013 2015 of 195 L/p/d;
- The addition of a 50% safety factor to water consumption to allow for future variations including changes in demographics. For example the "10 Year Housing & Homeless Plan" prepared by the County of Wellington in 2013 identified eight goals to address affordable housing and homelessness. One of eight goals within this report is to "Encourage the development of Secondary Suites; allowing groups such as low-income seniors or adults with a disability to live independently in their community close to family and friends." Although it is hard to quantify the impact this would have on water and wastewater flows, we are confident that the creation of Secondary Suites within the existing community and/or future development areas would increase the water and wastewater flows from each property.
- A recommended inflow and infiltration allowance of 90 L/p/d for all gravity based sewers based upon MOECC Guidelines;

The Technical Memorandum also included a comparison of the residential per capita flow rate and the inflow and infiltration flow used by other Municipalities around Erin, which are summarized below:

| Region/Municipality                          | Residential Per<br>Capita Flow | Inflow/Infiltration                            |
|--|--------------------------------|--|
| Erin Class EA Phase 3 & 4                    | 290 L/p/d                      | 90 L/p/d                                       |
| Region of Waterloo and member Municipalities | 350 L/p/d                      | 0.15 litre per hectare<br>per second allowance |
| City of Guelph                               | 350 L/p/d                      | 0.15 litre per hectare<br>per second allowance |
| Region of Peel and member Municipalities     | 303 L/p/d                      | 0.2 litre per hectare<br>per second allowance  |
| Region of Halton and member Municipalities   | 275 L/p/d                      | 0.286 litre per hectare per second allowance   |
| City of Barrie                               | 225 L/p/d                      | 0.1 litre per hectare<br>per second allowance  |

As noted above, most other adjacent Municipalities calculate Inflow/Infiltration using a "litres per hectare per day allowance" which typically yields wastewater flows substantially higher than using a per capita flow allowance. However, this is appropriate given that these other Municipalities have aging collection systems which as they deteriorate over time allow larger amounts of water to infiltrate into the system. Whereas, the Erin system will be completely new and considering the underlying soil conditions in the communities, we have utilized the MOECC suggested inflow/infiltration per capita flow rate of 90 L/p/d, which is lower than the comparable inflow and infiltration being allowed for in the aforementioned collection systems.

Utilizing the 380 (290 + 90) litres per person flow allowance, the Wastewater Treatment Plant and associated collection system to service the full buildout scenario (14,600 $\pm$  residential pop.) needs to be able to accommodate an Average Date Flow (ADF) of 7,172 m<sup>3</sup>/day (approx. 7.2 Megalitres per day). The Preliminary Capital Cost estimates presented to Council on January 9 were based upon this flow capacity.

#### Alternative per capita flow allowance

We have examined the effect on the Wastewater Treatment Plant and associated collection system from lowering the residential flow rate from 290 L/p/d to 225 L/p/d. This would reduce the safety factor over the current water consumption values from 50% to 15%.

Utilizing the same Infiltration/Inflow allowance of 90 L/p/d would create a total residential flow rate of 315 L/p/d (as opposed to 380 L/p/d). The change would have the following impacts:

- The capacity of the Wastewater Treatment Plant capable of servicing the full buildout scenario (14,600± residential pop.) would be reduced from 7.2 MLD to 6.23 MLD. This would have the effect of reducing Preliminary Capital Cost estimate by approximately \$6.8 million (\$61.1 million to \$54.3 million);
- The trunk sewer system including pumping stations and forcemains capable of servicing the full buildout scenario (14,600± residential pop.), could have some of the components downsized resulting in a cost saving of approximately \$2.0 million.
- All the local sewers servicing the existing areas would continue to be the minimum sewer size of 200 mm diameter, as such there would no reduction in costs.

Therefore, reducing the residential flow rate from 380 L/p/d to 315 L/p/d could save approximately \$8.8 million from the previously calculated Preliminary Capital Cost to service full buildout (14,600± residential pop.) of \$118 million. This cost saving would be shared between the existing community and developers.

#### **Recommendation**

Although the aforementioned cost savings are significant, we recommend that we do not change and that we continue to use 380 L/p/d as the residential flow rate for the following reasons:

- The proposed per capita residential flow of 290 L/p/d is similar to or below other Municipalities' design standards.
- The Inflow/Infiltration flows of 90 L/p/d is substantially lower than the design standards used by other Municipalities;
- The current average municipal water consumption rate is low and represents a "conserved" demand level. This is likely due to the water rates and the restrictions associated with use of septic systems. Following removal of the septic system restriction, it may be anticipated that development on existing properties will increase the water demand and wastewater flows from these properties.
- The development of Secondary Suites on existing properties, as per the strategy developed by Wellington County to address affordable housing and homelessness throughout the region would increase the water & wastewater flows.

- The life of many of the wastewater infrastructure components can be expected to be between 80 to 100 years. While some components such as treatment components and equipment will have a shorter expected life, other critical components such as the trunk sewer system and the treatment plant infrastructure will service the community for many decades and through several future Official Plan review processes.
- Subsequent to the Wastewater Class EA, an Official Plan review process will be undertaken to define the level, location and type of growth within the community. Until this work is completed there will remain a degree of uncertainty associated with determining wastewater flows and it is therefore considered prudent to retain some flexibility in the capacity analysis.
- Implementation of the recommendations arising out of this Urban Centre Wastewater Servicing Class EA, represent a considerable long-term infrastructure investment for the Town.
- Securing approvals for a 7.2 MLD discharge to the Credit River provides the Town with great flexibility moving forward with the planning process.

However, should the Town wish Ainley to reduce the residential per capita flow rate of 380 L/p/d to 315 L/p/d then the following previously completed Reports/Technical Memorandum would have to be revised and updated:

- Assimilative Capacity Study (ACS);
- Technical Memorandum System Capacity and Sewage Flows;
- Technical Memorandum Pumping Stations and Forcemain;
- Technical Memorandum Treated Effluent Outfall Site Selection;
- Technical Memorandum Treatment Technology Alternatives.

The engineering fees to revise, review and finalise these reports is \$40,000. Should the Town wish to move forward with the revisions, it is suggested that this could be done after the upcoming PIC and incorporated into the Environmental Study Report (ESR).

Yours truly,

## **AINLEY & ASSOCIATES LIMITED**

Liz Armstrong Box 430 Erin ON N0B 1T0

Email: liz@lizarmstrong.ca

#### Ref: Corporation of the Town of Erin Urban Centre Wastewater Services Class Environmental Assessment (Phase 3 & 4)

Dear Ms Armstrong:

On behalf of the Town of Erin, we wish to thank you for your interest in the above-mentioned Class EA. We have reviewed your comments which were received on February 3, 2018. For convenience we have provided your comments, in blue, followed by our responses.

1) At your Friday February 2, 2018 public meeting at Centre 2000, there were no display boards presenting capital costs, operating costs and carrying charges for the selected scenarios. This would have provided taxpayers with an indication of the estimated costs they will have to pay for their new sewage collection and treatment system. The Mayor and Council were told on January 9 that the capital cost for Phase 1, collection and treatment, will be in the range of \$50,000,000 to \$60,000,000. Yet, according to our reading of your numbers in the detailed collection system and treatment plant reports, the Phase 1 preferred option for the collection system is \$52,206,000 (not including the operation and NPV) and the Phase 1 treatment plant cost is \$43,052,500. Hence, is it not correct that the Phase 1 capital costs for the collection and treatment system could in fact be \$95,258,500? Could you please identify how you arrived at the figure of \$50-\$60 million as presented January 9 at the Council meeting, and verbally reported on Friday evening? What does this \$50-60 million include? Does it cover the operation and NVP of the collection system, life cycle costs and extras such as applicable taxes?

The Phase 2 collection system expansion has an estimated cost of \$39,039,000 and the treatment plant expansion is estimated to be an additional \$18,044,000 for a Phase 2 cost of \$57,083,000 and a total project cost of \$152,341,500. If correct, why were these costs not presented at the meeting as a summary of your study conclusions?

Display boards did address the capital cost of the system as well as the connection costs and operations costs. The capital cost of full build out was shown as \$118 million. The cost share between the Town and Developers was identified as between \$50 to \$60 million for the Town and \$58 to \$68 million for the developers. We do understand that there was confusion at the PIC as some attendees were informed the Town cost would be \$95 million and the total cost would be over \$150 million. These costs are incorrect and arise out of a misinterpretation of the costs as presented in the Phase 3 background reports.

The project team is preparing a capital cost summary report and this will be included in the Environmental Study Report.

Connection costs were also shown as an average cost. Additional detail was included in the Septic Survey Technical Memorandum; however, this detail will also be included in the capital cost summary report.

It was further illustrated on the display boards and in the presentation that the Town could not finance a project between \$50 to \$60 million and that a government grant was needed to bring to Town cost share within their debt carrying capacity. Again, this will be explained in more detail in the cost report.

During the presentation it was explained that the cost sharing with developers would depend on the actual location of the developments and the extent of integration of the collection system as well as the implementation plan. This is the reason that the Town cost share was reported as a range. Notwithstanding, the Town cannot finance the Town share and will need to secure a grant.

2) We are still very concerned with the per person wastewater generation rates used in the project. In investigating this issue, we learned that in Victoria, Stantec is using a per capita design figure of 195 lpcd. There is an extensive database available in Victoria showing that, on average, each resident generates 145 lpcd; this includes the l&I contribution which in certain areas of Victoria is considerable. The additional 50 lpcd addresses the contribution of commercial, institutional and industrial contributors. There is also a City of Calgary report which addresses individual water consumption for water fixtures and appliances and its database shows that 100 lpcd is readily achievable if state-of-the-art water conservation devices are installed. This consumption rates drops to 75 lpcd if greywater recovery, treatment and reuse is applied. These are examples of designs accepted by consulting engineering firms. Why would an aggressive water conservation program not be considered as a top priority for a community like the Town of Erin, and especially for new developments in the Town?

Since new development will represent 60% of the contributing flow to the treatment plant, an aggressive water conservation strategy could be implemented that would easily reduce water consumption and thus wastewater generation to less than 150 lpcd. For all existing residential homes and the commercial and institutional facilities, a water conservation program could be introduced whereby each homeowner who installs water conserving devices receives a rebate of up to 50% of the cost of fixtures. In addition to reducing wastewater flows to be treated, the program would have a significant impact on the cost of water supply for the communities. Your comments please.

This issue has already been addressed by Council who requested Ainley to further investigate the recommended per capita flow rates contained in our Capacity Technical Memorandum. A letter report was considered and approved by Council and it was decided to retain the recommended per capita flow rate of 290 lpcd with an allowance for inflow and infiltration of 90 lpcd for a total of 380 lpcd. The contents of the letter report will form a part of the ESR. This per capita flow rate also allows for additional resiliency within the overall system for future adjustments such as climate change,

We fully understand the wide range of water consumption experienced across Canada and the trend to lower consumption as a result of conservation efforts and plumbing code revisions. We would sincerely hope that water consumption and wastewater flows are less than our recommended design flows, however these actual flows are distinctly different from design flows which are used to size pipes that will be in the ground for many decades. In most cases, the design number does not change the size of the sewer which is the minimum size allowed by MOECC. It should also be noted that Municipalities in Ontario must report the flows to their wastewater plants to MOECC on an annual basis. These flows are used to calculate plant reserve capacity and Municipalities can only allocate

growth up to the limit of this reserve capacity. In this way, the actual flow to the plant is taken into consideration in terms of the service population and in any future expansion.

3) The scheduling of activities on this project will be extremely complex. If the sewers are installed before the treatment plant is built, there will be sewage and no treatment, which will not be allowed. So, the treatment plant will have to be constructed before the collection system is operational. Because of the extremely restrictive receiving stream requirements, how will this be achieved? What is the penalty if the effluent limits presented in Table 5 of the Treatment Technology Alternatives report are exceeded? Are these never to exceed numbers or are they monthly averages for flow proportioned composite samples collected every day?

This would be a typical project to service and existing community with sewers and a sewage treatment plant. It is actually easier to commission a new treatment plant connected to an existing community rather than a new community where it takes longer to generate flows. Typically, the wastewater treatment plant and collection system are built in parallel and when the treatment plant is functional and commissioned and ready to receive wastewater, property connections can start to be made to the sewers. The wastewater treatment plant would be tested using clean water after which, when ready the plant would be seeded with biological sludge from another plant. Most typically the lower initial flows will be easy to treat.

The extent of the monitoring program that will be issued by MOECC in the Environmental Compliance Certificate is not yet known. However, the plant must be operated in a manner that prevents any of the effluent limits from ever being exceeded.

4) There was reference made at the meeting to the Town's existing stormwater collection system. Where is the stormwater discharged? Is there any stormwater treatment prior to discharge? What are the water quality limits on the stormwater discharges?

The reference to stormwater management at the recent PIC was in direct response to a question relating to existing sewer pipes within the municipal road allowance and in particular we advised that any of existing sewer pipes within the road allowance would be related to the existing stormwater collection system. Further to this, all of the existing roads throughout the Town would have stormwater collection and disposal systems in accordance with the measures that were constructed when the roads were originally built. The design and construction of a new wastewater collection system throughout the existing communities will not alter or impede any of the original stormwater collection and/or disposal systems.

Thank you again for your interest in this Class EA.

Yours truly,

**AINLEY & ASSOCIATES LIMITED**

## 357-2019-1533

Ms. Liz Armstrong Box 430 Erin ON N0B 1T0

Dear Ms. Armstrong:

Thank you for your interest in the Erin Urban Centre Wastewater Servicing Class Environmental Assessment as proposed by the Town of Erin. I welcome your comments on this project.

On June 26, 2018, you requested that the Town be required to prepare an individual environmental assessment for the Erin Urban Centre Wastewater Servicing Class Environmental Assessment. I am taking this opportunity to inform you that I have decided that elevating the project to an individual environmental assessment is not required.

In making this decision, I have given careful consideration to the project documentation, the provisions of the Municipal Class Environmental Assessment, the issues raised in the requests, and relevant matters to be considered under section 16 of the Environmental Assessment Act.

The Municipal Class Environmental Assessment is a process by which proponents plan and develop projects of this type, including evaluating alternatives, assessing environmental effects, developing mitigation measures, and consulting with the public, without having to obtain approval from me and the Lieutenant Governor in Council for each individual project.

The Municipal Class Environmental Assessment has itself been subject to review and approval under the Act, which determined, in part, that the application of the Municipal Class Environmental Assessment process would enable proponents to meet the intent and purpose of the Act. The Town has demonstrated that it has planned and developed Ms. Liz Armstrong Page 2.

this Project in accordance with the provisions of the Municipal Class Environmental Assessment. I am satisfied therefore that the purpose of the Act, "the betterment of the people of the whole or any part of Ontario by providing for the protection, conservation and wise management in Ontario of the environment," has been met for this project.

The concerns raised, together with the reasons for my decision, are set out in the attached table. I am satisfied that the issues and concerns have been addressed by the work done to date by the Town or will be addressed in future work that is required to be carried out.

With this decision having been made, the Town can now proceed with the project, subject to any other permits or approvals required. The Town must ensure it implements the project in the manner it was developed and designed, as set out in the project documentation, and inclusive of all mitigating measures, and environmental and other provisions therein.

Again, I would like to thank you for participating in the Class Environmental Assessment process and for bringing your concerns to my attention.

Sincerely,

Jeff Yurek Minister

Attachment

# Erin Urban Centre Wastewater Servicing – Town of Erin Municipal Class Environmental Assessment

Minister's Review of Issues Raised by Requesters

| Issue   | Response and Analysis  |
|---|--|
| Class Environmental Assessment Process  |  |
| Downstream<br>communities were not<br>adequately consulted<br>because of the distance<br>from the proposed<br>project, however,<br>impacts from the project<br>will be realized<br>downstream.  | The Town of Erin followed the requirements of the Municipal<br>Class Environmental Assessment document for<br>consultation, along with guidance from Ministry of<br>Environment, Conservation and Parks.<br>The Town developed a list of local residents, agencies, and<br>Indigenous groups and it was updated throughout the class<br>environmental assessment process. The list of agencies<br>included the Town of Caledon and Region of Peel which are<br>downstream of the project site. The consultation list was<br>used for the distribution of project notices and<br>communications related to the project. The Town also<br>published notices in local newspapers and on the Town's<br>website. Two public information centers were held in 2016<br>and 2018 to provide the public the opportunity to submit<br>comments to be considered in the preparation of the<br>environmental study report. This consultation included the<br>communities located downstream. Concerns about the<br>discharge location, quality of drinking water, and odour<br>impacts were discussed during the consultation requirements<br>of Municipal Class Environmental Assessment. |
| Decentralized plant<br>alternatives (subsurface<br>disposal and a two-<br>treatment plant system)<br>were not considered<br>resulting in an<br>inadequate examination<br>of alternatives.<br>Cost comparisons<br>between a single system<br>solution and<br>decentralized systems | The Municipal Class Environmental Assessment requires<br>that proponents consider alternatives based on existing<br>baseline conditions and identify if alternatives will have a<br>potential impact on the natural, social, and economic<br>environments. Based on feedback from the public<br>consultation process following the Servicing and Settlement<br>Master Plan in 2014, a further examination of servicing<br>options such as subsurface disposal (septic tank) solutions<br>and a two-treatment plant alternative was undertaken.<br>It was determined that subsurface disposal options were<br>limited due to the topography, system of wetlands, source<br>water protection areas, and lack of available land space.  |

| Issue  | Response and Analysis   |
|--|---|
| was not undertaken.  | Credit Valley Conservation has indicated that future<br>development should not include septic systems due to<br>potential cumulative impacts these systems may have on<br>the natural environment and water quality.  |
|  | A two-treatment plant alternative was investigated in the<br>environmental study report. The evaluation examined the<br>feasibility of having a wastewater treatment plant dedicated<br>to Hillsburgh and Erin Village rather than having a single<br>plant servicing both communities. It was determined that<br>costs to build and operate two treatment plants were higher<br>than operating a single plant. The cost difference exceeded<br>the \$5 million required to construct a connection pipe<br>between the two communities to a single treatment plant.   |
|  | two-plant alternative were not viable and as such further<br>cost analysis was not undertaken. The ministry and Credit<br>Valley Conservation reviewed the subsurface disposal and<br>the two-plant alternatives analysis and are in agreement with<br>the conclusions.   |
|  | I am satisfied that the Town fulfilled the alternative evaluation requirements of the Municipal Class Environmental Assessment.   |
| Natural Environment  |   |
| Impacts to river water<br>quality and fish health<br>from chemicals in<br>effluent discharge<br>including chloride and | The wastewater treatment plant will have to operate under<br>requirements of an environmental compliance approval<br>issued by the ministry that sets strict effluent limits and<br>operating conditions related to chloride, ammonia and other<br>contaminants.  |
|  | Credit Valley Conservation provided recommendations to<br>the Town following the filing of the environmental study<br>report to control the input of chloride at the source. For<br>example, Credit Valley Conservation recommended that<br>agreements for new subdivisions contain conditions<br>requiring high efficiency water softeners for each lot to<br>reduce chloride in wastewater (water softeners are a<br>significant source of chloride). The Town has agreed to<br>implement the comments and recommendations received<br>from Credit Valley Conservation during project<br>implementation. Ministry technical staff and the Ministry of |

| Issue   | Response and Analysis  |
|---|--|
|   | Natural Resources and Forestry support the recommendations provided by Credit Valley Conservation.   |
|   | Ministry technical staff will require the ongoing monitoring of<br>chloride levels in the influent, effluent, and the West Credit<br>River receiving water in the Town's environmental<br>compliance approval. The Town has agreed to the ministry's<br>requirement for ongoing monitoring of chloride levels after<br>the wastewater treatment plant has been constructed. The<br>Ministry of Natural Resources and Forestry and Credit<br>Valley Conservation support the ministry's chloride<br>monitoring condition in the environmental compliance<br>approval.   |
|   | Toxicity of ammonia to fish species was a key factor in<br>Town's development of effluent limits and objectives for<br>effluent discharge to the West Credit River. The proposed<br>criteria for ammonia was selected after analysis and<br>modelling of the receiving water and considering protection<br>of aquatic life. The proposed effluent limits represent a high<br>level of treatment for ammonia at 0.6 milligrams per litre at<br>full build out and remain below the Provincial Water Quality<br>Objective. The ministry and Credit Valley Conservation are<br>satisfied with the proposed effluent limits including ammonia<br>discharge limits. The proposed effluent limits for ammonia<br>will be subject to meeting the requirements under the plant's<br>environmental compliance approval. |
|   | I am satisfied that the Town's proposed effluent limits meet<br>ministry requirements for wastewater treatment operations<br>discharging to surface waters.  |
| Pharmaceuticals and<br>personal care products<br>in effluent discharge will<br>impact hormone systems<br>in fish and their<br>reproductive success. | Pharmaceuticals and personal care products can originate<br>from numerous sources in wastewater effluent. Some<br>pharmaceutical products are endocrine disruptors, some of<br>which have estrogenic properties that can interfere with<br>hormone systems resulting in the feminization of male fish<br>and impacts to fish reproductive success. Ministry technical<br>staff are aware of the potential effects of pharmaceutical<br>compounds and other endocrine disruptors, as this is an<br>active research field.   |
|   | The Ministry of Natural Resources and Forestry<br>recommended that the proposed Erin wastewater treatment<br>plant include higher treatment processes to assist with the<br>removal of pharmaceutical compounds with estrogenic  |

| Issue   | Response and Analysis   |
|---|---|
|   | properties.   |
|   | In recognizing the need to protect an important fish<br>community in the river, the Town chose tertiary treatment as<br>it was necessary to achieve a high quality of effluent. The<br>advanced wastewater treatment process (Membrane<br>Bioreactor) that is being proposed for the treatment plant<br>can generally achieve high removal rates of endocrine<br>disruptors/estrogen compounds compared with conventional<br>wastewater treatment processes.  |
|   | It has been the observation of scientists and engineers,<br>including ministry technical experts, that the higher the level<br>of treatment employed by a wastewater treatment plant, the<br>greater the reduction of pharmaceutical and other<br>compounds in final effluent.  |
|   | I am satisfied that the Town considered measures to reduce<br>impacts associated with pharmaceuticals and personal care<br>products in wastewater effluent.   |
| The effluent discharge<br>mixing zone in the river<br>will create a barrier for<br>fish movement. | No barrier to fish movement is predicted for the discharge<br>outfall. Under the full wastewater treatment plant capacity<br>modelling, the effluent discharge mixing zone will not extend<br>across the full width of the river. Water quality modeling of<br>the effluent mixing zone defined the extent of the plume<br>before the effluent is fully mixed and water quality<br>parameters are below the Provincial Water Quality<br>Objectives for surface waters. The outfall mixing zone would<br>be non-toxic in nature and has been modelled to occupy<br>approximately 40% of the channel width. |
|   | In order to maintain safe passage for fish and avoid the<br>effluent mixing plume to extend over the entire width of the<br>river, the outfall pipe will include multiple openings for better<br>effluent mixing and will be configured parallel to the south<br>bank of the West Credit River. The preferred design<br>minimizes the width of the river which effluent would mix and<br>maintains a larger area outside the zone of mixing allowing<br>for fish to pass along the opposite side of the diffuser.   |
|   | I am satisfied that the Town considered outfall design alternatives to accommodate fish passage.  |
| Direct spills of raw  | The Erin Urban Wastewater Servicing class environmental   |

| Issue   | Response and Analysis   |
|---|---|
| sewage from flood<br>conditions, dry<br>conditions and<br>unreported sewage<br>dumps will pollute the<br>downstream river.  | assessment proposed mitigation and management practices<br>to ensure the protection of the river through flooding and dry<br>conditions. The proposed wastewater system will be a new<br>system designed for peak flows beyond the proposed<br>servicing capacity in accordance with ministry guidelines<br>and to protect the West Credit River. The recommended<br>size of the wastewater system and daily flow rate ensures<br>long-term performance and the avoidance of potential spills.<br>Potential spills are avoided by preventing the capacity of all<br>wastewater system components from exceeding any flow<br>conditions. |
|   | The environmental study report includes an overflow risk<br>management technical memorandum that addresses the<br>potential for spills and mitigation actions to minimize the risk<br>of spill, including inspections and preventative maintenance.<br>Credit Valley Conservation is satisfied and will be consulted<br>during the final design stage of the project on how the<br>mitigation actions will be implemented into the final design.  |
|   | The West Credit River must have enough river flow under<br>dry conditions to receive treated effluent and maintain river<br>water quality. A dry weather low flow model was used for<br>water quality modeling. Based on the water quality modelling<br>and analysis, the effluent discharge location has been<br>assessed for the projected worse case scenario when the<br>wastewater system is operating at full capacity.   |
|   | I am satisfied that adequate design capacity and mitigation measures are proposed to protect the West Credit River from potential spills.   |
| Environmental impacts<br>to the cold-water fishery<br>(Rainbow Trout, Brook<br>Trout, Brown Trout,<br>Chinook Salmon) and<br>species at risk in the<br>Credit River Valley was<br>not adequately<br>considered. | While the project will generate short-term impacts on the<br>natural environment through construction, potential long-<br>term impacts are not expected. Credit Valley Conservation<br>and ministry technical staff reviewed the project<br>documentation and are satisfied with the proposed effluent<br>discharge objectives and limits. Final effluent limits and<br>objectives for treated wastewater discharge will be issued<br>and regulated by the ministry's environmental compliance<br>approval.   |
|   | The environmental study report recognizes the local<br>ecosystem in the valley of the West Credit River that<br>supports an important population of fish and species at risk.<br>Water quality modeling defined effluent objectives and limits  |

| Issue  | Response and Analysis   |
|--|---|
|  | to ensure appropriate treatment was set to meet water<br>quality objectives and protect important cold-water fish<br>species in the river. In addition, a detailed thermal<br>assessment was done to ensure effluent discharge<br>temperatures did not pose a threat to cold-water fish<br>survival, growth and reproduction.   |
|  | Potential impacts to the environment and species as well as<br>mitigation measures are documented in the environmental<br>study report. The proposed mitigation measures include<br>performing construction activities outside of the breeding or<br>spawning season of sensitive species or species at risk and<br>developing an environmental management plan prior to<br>construction. The environmental management plan will<br>further define environmental mitigation and protection<br>measures, establish inspections and monitoring, and provide<br>contingency planning.  |
|  | I am satisfied with the proposed effluent discharge limits and mitigation measures for species at risk.   |
| Project  |   |
| The size of the<br>wastewater facility and<br>proposed wastewater<br>flow rate of 380 litres per<br>person per day is<br>beyond what is needed<br>for population projections<br>and does not align with<br>other communities that<br>are implementing water<br>conservation initiatives. | The recommended flow rate is similar or below other<br>adjacent municipalities' design standards. The population<br>projection utilized to estimate full build out in the Town of<br>Erin was identified in the Town's Official Plan and agreed<br>with Wellington County Planning Department. The proposed<br>project is within design parameters to ensure efficient and<br>reliable performance and does not conflict with water<br>conservation initiatives by the Town. The ministry and Credit<br>Valley Conservation reviewed the capacity technical<br>memorandum for compliance with capacity requirements<br>and are in agreement with the sizing of the proposed<br>wastewater system. |
| proposed inflow and<br>infiltration rate (90 litres<br>per person) would<br>reduce costs and the<br>size of the facility.  | A 380 litres per person per day wastewater flow rate was<br>developed by combining the residential flow rate of 290 litres<br>per person per day and the inflow and infiltration rate<br>(groundwater and stormwater that enter into the wastewater<br>system) of 90 litres per person per day. The proposed<br>wastewater flow rate value was based on actual water<br>usage records from the communities between 2013 and<br>2015 with the addition of a safety factor for water<br>consumption to account for future variations and extra  |

| Issue  | Response and Analysis  |
|--|--|
|  | growth. Extra capacity is an industry standard intended to offset loss of efficiency as the wastewater system ages over an 80-year lifecycle.  |
|  | The 380 litres per person waste flow rate per day falls within the ministry's guidelines for recommended municipal wastewater system flow rates.   |
|  | I am satisfied that the Town has appropriately characterized<br>the wastewater system capacity as part of the Municipal<br>Class Environmental Assessment study.   |
| Operating and<br>maintenance costs<br>should be fully estimated<br>so that long-term<br>economic impacts on the<br>Town and residents are<br>considered. | The Municipal Class Environmental Assessment requires a consideration of the economic impacts of any proposed undertaking that is restricted to capital, operating, and maintenance cost estimations. Government grants pay for infrastructure that services the existing community. Funding is expected to be generated through the development charges that will result from new residential and commercial development approvals in the Town of Erin.   |
|  | Based on public feedback and concerns on the system cost,<br>a capital cost summary report was prepared and included in<br>the environmental study report. The environmental study<br>report outlines the estimated cost of all aspects of the<br>project including capital and operating costs that references<br>user rates from similar and adjacent wastewater facilities.<br>The cost estimate is based on the actual length and depth of<br>sewers, connection pipes, and pumping stations and is<br>considered accurate. Capital and operating cost estimates<br>were based on similar neighbouring wastewater treatment<br>plants as well as quotations obtained from a range of<br>vendors for equipment. |
|  | The capital cost of full development build out is<br>approximated at \$118 million. The cost share between the<br>Town and developers has been identified as between \$50 to<br>\$60 million for the Town, and \$58 to \$68 million for the<br>developers. The Town requires government financing for the<br>project or it cannot proceed.   |
|  | I am satisfied that adequate consideration of economic impacts was provided as per the Municipal Class Environmental Assessment requirements.  |

| The assimilative capacity<br>study did not have ten<br>years of river flow data<br>required by Credit Valley<br>Conservation Authority<br>for the Town to make<br>adequate project<br>decisions. | The environmental study report includes an assimilative capacity study that modeled the West Credit River's capacity to receive wastewater effluent without damaging water quality and quantity. The Credit River Conservation established a low river flow value for the West Credit River which was used as the design flow for the assimilative capacity modeling. While there was no river flow data for a 10-year period at the preferred effluent discharge site located at 10 <sup>th</sup> Line and Winston Churchill Boulevard, the low flow index was based on accumulated flow data on the same river at two other locations downstream. The data use for the projections was greater than 10 years and was combined with recent flow data at the project location to calculate a flow index. The combined data was approved for the required analysis by the Credit River Conservation and the ministry. |
